| <b>CHAPTER 1 COMMANDS FOR ACL .....</b>                      | <b>1-1</b> |
| 1.1 ABSOLUTE-PERIODIC/PERIODIC.....                          | 1-1        |
| 1.2 ABSOLUTE START .....                                     | 1-1        |
| 1.3 ACCESS-LIST DENY-PREEMPTION .....                        | 1-2        |
| 1.4 ACCESS-LIST (IP EXTENDED).....                           | 1-2        |
| 1.5 ACCESS-LIST (IP STANDARD).....                           | 1-3        |
| 1.6 ACCESS-LIST(MAC EXTENDED).....                           | 1-3        |
| 1.7 ACCESS-LIST(MAC-IP EXTENDED).....                        | 1-4        |
| 1.8 ACCESS-LIST(MAC STANDARD) .....                          | 1-5        |
| 1.9 CLEAR ACCESS-GROUP STATISTIC .....                       | 1-6        |
| 1.10 FIREWALL .....  | 1-6        |
| 1.11 IP ACCESS EXTENDED.....                                 | 1-6        |
| 1.12 IP ACCESS STANDARD .....                                | 1-6        |
| 1.13 IPV6 ACCESS-LIST .....                                  | 1-7        |
| 1.14 IPV6 ACCESS STANDARD .....                              | 1-7        |
| 1.15 IPV6 ACCESS EXTENDED.....                               | 1-7        |
| 1.16 {IP IPV6 MAC MAC-IP} ACCESS-GROUP .....                 | 1-7        |
| 1.17 {IP IPV6 MAC MAC-IP} ACCESS-GROUP (INTERFACE MODE)..... | 1-8        |
| 1.18 MAC ACCESS EXTENDED.....                                | 1-8        |
| 1.19 MAC-IP ACCESS EXTENDED.....                             | 1-8        |
| 1.20 PERMIT   DENY (IP EXTENDED).....                        | 1-8        |
| 1.21 PERMIT   DENY(IP STANDARD) .....                        | 1-9        |
| 1.22 PERMIT   DENY(IPV6 EXTENDED).....                       | 1-10       |
| 1.23 PERMIT   DENY(IPV6 STANDARD) .....                      | 1-10       |
| 1.24 PERMIT   DENY(MAC EXTENDED).....                        | 1-11       |
| 1.25 PERMIT   DENY(MAC-IP EXTENDED).....                     | 1-12       |
| 1.26 SHOW ACCESS-LISTS .....                                 | 1-13       |
| 1.27 SHOW ACCESS-GROUP .....                                 | 1-14       |
| 1.28 SHOW FIREWALL.....                                      | 1-14       |
| 1.29 SHOW IPV6 ACCESS-LISTS .....                            | 1-14       |
| 1.30 SHOW TIME-RANGE .....                                   | 1-15       |
| 1.31 TIME-RANGE.....   | 1-15       |

|  |            |
|--|------------|
| <b>CHAPTER 2 COMMANDS FOR SELF-DEFINED ACL .....</b> | <b>2-1</b> |
| 2.1 USERDEFINED-ACCESS-LIST STANDARD OFFSET .....    | 2-1        |
| 2.2 USERDEFINED-ACCESS-LIST EXTENDED OFFSET .....    | 2-1        |
| 2.3 USERDEFINED-ACCESS-LIST STANDARD .....           | 2-1        |
| 2.4 USERDEFINED-ACCESS-LIST EXTENDED .....           | 2-2        |
| 2.5 USERDEFINED ACCESS-GROUP .....                   | 2-2        |
| 2.6 VACL USERDEFINED ACCESS-GROUP .....              | 2-2        |
| <b>CHAPTER 3 COMMANDS FOR 802.1X .....</b>           | <b>3-1</b> |
| 3.1 DEBUG DOT1X DETAIL .....                         | 3-1        |

| 3.27 DOT1X TIMEOUT TX-PERIOD .....                   | 3-8        |
| 3.28 DOT1X UNICAST ENABLE .....                      | 3-8        |

|  |      |
|--|------|
| 3.29 DOT1X WEB AUTHENTICATION ENABLE .....           | 3-9  |
| 3.30 DOT1X WEB AUTHENTICATION IPV6 PASSTHROUGH ..... | 3-9  |
| 3.31 DOT1X WEB REDIRECT .....                        | 3-9  |
| 3.32 DOT1X WEB REDIRECT ENABLE .....                 | 3-9  |
| 3.33 SHOW DOT1X .....                                | 3-9  |
| 3.34 USER-CONTROL LIMIT.....                         | 3-10 |
| 3.35 USER-CONTROL LIMIT IPV6 .....                   | 3-10 |

## CHAPTER 4 COMMANDS FOR THE NUMBER LIMITATION

### FUNCTION OF MAC AND IP IN PORT, VLAN ..... 4-1

|  |     |
|--|-----|
| 4.1 DEBUG IP ARP COUNT .....                     | 4-1 |
| 4.2 DEBUG IPV6 ND COUNT .....                    | 4-1 |
| 4.3 DEBUG SWITCHPORT ARP COUNT .....             | 4-1 |
| 4.4 DEBUG SWITCHPORT MAC COUNT.....              | 4-2 |
| 4.5 DEBUG SWITCHPORT ND COUNT .....              | 4-2 |
| 4.6 IP ARP DYNAMIC MAXIMUM .....                 | 4-2 |
| 4.7 IPV6 ND DYNAMIC MAXIMUM.....                 | 4-3 |
| 4.8 SHOW ARP-DYNAMIC COUNT .....                 | 4-3 |
| 4.9 SHOW MAC-ADDRESS DYNAMIC COUNT .....         | 4-3 |
| 4.10 SHOW ND-DYNAMIC COUNT .....                 | 4-4 |
| 4.11 SWITCHPORT ARP DYNAMIC MAXIMUM.....         | 4-4 |
| 4.12 SWITCHPORT MAC-ADDRESS DYNAMIC MAXIMUM..... | 4-5 |
| 4.13 SWITCHPORT MAC-ADDRESS VIOLATION.....       | 4-5 |
| 4.14 SWITCHPORT ND DYNAMIC MAXIMUM .....         | 4-6 |
| 4.15 VLAN MAC-ADDRESS DYNAMIC MAXIMUM .....      | 4-6 |

### CHAPTER 5 COMMANDS FOR AM CONFIGURATION ..... 5-1

|                          |     |
|--------------------------|-----|
| 5.1 AM ENABLE .....      | 5-1 |
| 5.2 AM PORT .....        | 5-1 |
| 5.3 AM IP-POOL.....      | 5-1 |
| 5.4 AM MAC-IP-POOL ..... | 5-1 |
| 5.5 NO AM ALL .....      | 5-1 |
| 5.6 SHOW AM.....         | 5-2 |

### CHAPTER 6 COMMANDS FOR SECURITY FEATURE ..... 6-1

|   |     |
|---|-----|
| 6.1 DOSATTACK-CHECK SRCIP-EQUAL-DSTIP ENABLE..... | 6-1 |
|---|-----|

|  |            |
|--|------------|
| 6.2 DOSATTACK-CHECK IPV4-FIRST-FRAGMENT ENABLE .....       | 6-1        |
| 6.3 DOSATTACK-CHECK TCP-FLAGS ENABLE.....                  | 6-1        |
| 6.4 DOSATTACK-CHECK SRCPORT-EQUAL-DSTPORT ENABLE.....      | 6-1        |
| 6.5 DOSATTACK-CHECK TCP-FRAGMENT ENABLE .....              | 6-1        |
| 6.6 DOSATTACK-CHECK TCP-SEGMENT.....                       | 6-1        |
| 6.7 DOSATTACK-CHECK ICMP-ATTACKING ENABLE .....            | 6-1        |
| 6.8 DOSATTACK-CHECK ICMPV4-SIZE .....                      | 6-2        |
| 6.9 DOSATTACK-CHECK ICMPV6-SIZE .....                      | 6-2        |
| <b>CHAPTER 7 COMMANDS FOR TACACS+.....</b>                 | <b>7-1</b> |
| 7.1 TACACS-SERVER AUTHENTICATION HOST .....                | 7-1        |
| 7.2 TACACS-SERVER KEY .....                                | 7-1        |
| 7.3 TACACS-SERVER NAS-IPV4.....                            | 7-1        |
| 7.4 TACACS-SERVER TIMEOUT .....                            | 7-2        |
| 7.5 DEBUG TACACS-SERVER .....                              | 7-2        |
| <b>CHAPTER 8 COMMANDS FOR RADIUS.....</b>                  | <b>8-1</b> |
| 8.1 AAA ENABLE .....                                       | 8-1        |
| 8.2 AAA-ACCOUNTING ENABLE .....                            | 8-1        |
| 8.3 AAA-ACCOUNTING UPDATE .....                            | 8-1        |
| 8.4 DEBUG AAA PACKET.....                                  | 8-1        |
| 8.5 DEBUG AAA DETAIL ATTRIBUTE.....                        | 8-2        |
| 8.6 DEBUG AAA DETAIL CONNECTION .....                      | 8-2        |
| 8.7 DEBUG AAA DETAIL EVENT .....                           | 8-2        |
| 8.8 DEBUG AAA ERROR .....                                  | 8-2        |
| 8.9 RADIUS NAS-IPV4 .....                                  | 8-3        |
| 8.10 RADIUS NAS-IPV6 .....                                 | 8-3        |
| 8.11 RADIUS-SERVER ACCOUNTING HOST .....                   | 8-3        |
| 8.12 RADIUS-SERVER AUTHENTICATION HOST .....               | 8-4        |
| 8.13 RADIUS-SERVER DEAD-TIME .....                         | 8-5        |
| 8.14 RADIUS-SERVER KEY.....                                | 8-5        |
| 8.15 RADIUS-SERVER RETRANSMIT .....                        | 8-5        |
| 8.16 RADIUS-SERVER TIMEOUT.....                            | 8-6        |
| 8.17 RADIUS-SERVER ACCOUNTING-INTERIM-UPDATE TIMEOUT ..... | 8-6        |
| 8.18 SHOW AAA AUTHENTICATED-USER.....                      | 8-6        |
| 8.19 SHOW AAA AUTHENTICATING-USER.....                     | 8-7        |
| 8.20 SHOW AAA CONFIG .....                                 | 8-7        |

## CHAPTER 13 COMMANDS FOR CAPTIVE PORTAL

### AUTHENTICATION..... 13-1

13.1 COMMANDS FOR AUTHENTICATION FUNCTION ..... 13-1

13.1.1 ac-name..... 13-1

13.1.2 authentication roam enable ..... 13-1

13.1.3 captive-portal..... 13-1

13.1.4 captive-portal binding arp (it is not supported currently) ..... 13-1

13.1.5 captive-portal client deauthenticate ..... 13-2

13.1.6 captive-portal client re-auth log { enable | disable } ..... 13-2

13.1.7 captive-portal client keep-alive flow-detection enable ..... 13-2

13.1.8 captive-portal client keep-alive flow-detection interval ..... 13-2

13.1.9 captive-portal client keep-alive flow-detection number ..... 13-3

13.1.10 clear ..... 13-3

13.1.11 configuration ..... 13-3

13.1.12 debug captive-portal packet ..... 13-3

13.1.13 debug captive-portal trace ..... 13-4

|   |       |
|---|-------|
| 13.1.14 debug captive-portal alive-detail .....                     | 13-4  |
| 13.1.15 debug captive-portal alive-status .....                     | 13-4  |
| 13.1.16 debug captive-portal alive-time .....                       | 13-4  |
| 13.1.17 debug captive-portal error .....                            | 13-4  |
| 13.1.18 enable (global) .....                                       | 13-5  |
| 13.1.19 enable (instance) .....                                     | 13-5  |
| 13.1.20 external portal-server server-name .....                    | 13-5  |
| 13.1.21 http-redirect-filter <1-32> {ip A.B.C.D  domain WORD} ..... | 13-5  |
| 13.1.22 http-redirect-filter <1-32> .....                           | 13-6  |
| 13.1.23 name .....  | 13-6  |
| 13.1.24 nas-ipv4 .....  | 13-6  |
| 13.1.25 portal enable configuration <id> [vlan-pool WORD ] .....    | 13-6  |
| 13.1.26 portal-server .....   | 13-7  |
| 13.1.27 radius accounting .....                                     | 13-7  |
| 13.1.28 radius-accounting update interval .....                     | 13-7  |
| 13.1.29 radius-acct-server .....                                    | 13-7  |
| 13.1.30 radius-auth-server .....                                    | 13-8  |
| 13.1.31 redirect url-head <word> .....                              | 13-8  |
| 13.1.32 redirect attribute ssid enable .....                        | 13-8  |
| 13.1.33 redirect attribute ssid name .....                          | 13-8  |
| 13.1.34 redirect attribute nas-ip enable .....                      | 13-9  |
| 13.1.35 redirect attribute nas-ip name .....                        | 13-9  |
| 13.1.36 vlan-pool <1-255> <WORD> .....                              | 13-9  |
| 13.1.37 session-timeout .....                                       | 13-9  |
| 13.1.38 show captive-portal .....                                   | 13-10 |

| 15.1.4 ipv6 nd snooping trust .....   | 15-1            |
| 15.1.5 savi check binding .....   | 15-2            |
| 15.1.6 savi enable .....  | 15-2            |
| 15.1.7 savi ipv6 binding num .....  | 15-2            |
| 15.1.8 savi ipv6 check source binding.....                                      | 15-3            |
| 15.1.9 savi ipv6 check source ip-address mac-address.....                       | 15-3            |
| 15.1.10 savi ipv6 {dhcp-only   slaac-only   dhcp-slaac} enable .....            | 15-3            |
| 15.1.11 savi ipv6 mac-binding-limit .....                                       | 15-4            |
| 15.1.12 savi max-dad-dalay .....  | 15-4            |
| 15.1.13 savi max-dad-prepare-delay .....  | 15-4            |
| 15.1.14 savi max-slaac-life .....   | 15-4            |

|  |             |
|--|-------------|
| 15.1.15 savi timeout bind-protect.....           | 15-5        |
| <b>15.2 COMMANDS FOR MONITOR AND DEBUG .....</b> | <b>15-5</b> |
| 15.2.1 Monitor and Debugg.....                   | 15-5        |

# Chapter 1 Commands for ACL

## 1.1 absolute-periodic/periodic

**Command:** [no] absolute-periodic {Monday|Tuesday|Wednesday|Thursday|Friday|Saturday|Sunday}<start\_time>to{Monday|Tuesday|Wednesday|Thursday|Friday|Saturday| Sunday} <end\_time>

[no]periodic{{Monday+Tuesday+Wednesday+Thursday+Friday+Saturday+Sunday}|daily| weekdays | weekend} <start\_time> to <end\_time>

**Functions:** Define the time-range of different commands within one week, and every week to circulate subject to this time.

**Parameters:**

**Friday** (Friday)

**Monday** (Monday)

**Saturday** (Saturday)

**Sunday** (Sunday)

**Thursday** (Thursday)

**Tuesday** (Tuesday)

**Wednesday** (Wednesday)

**daily** (Every day of the week)

**weekdays** (Monday thru Friday)

**weekend** (Saturday thru Sunday)

**start\_time** start time ,HH:MM:SS (hour: minute: second)

**end\_time** end time,HH:MM:SS (hour: minute: second)

**Remark:** time-range polling is one minute per time, so the time error shall be <= one minute.

**Command Mode:** time-range mode

**Default:** No time-range configuration.

**Usage Guide:** Periodic time and date. The definition of period is specific time period of Monday to Saturday and Sunday every week.

day1 hh:mm:ss To day2 hh:mm:ss or

{[day1+day2+day3+day4+day5+day6+day7]|weekend|weekdays|daily} hh:mm:ss To hh:mm:ss

**Examples:** Make configurations effective within the period from 9:15:30 to 12:30:00 during

Tuesday to Saturday.

```
Switch(config)#time-range admin_timer
```

```
Switch(Config-Time-Range-admin_timer)#absolute-periodic Tuesday 9:15:30 to Saturday 12:30:00
```

Make configurations effective within the period from 14:30:00 to 16:45:00 on Monday, Wednesday, Friday and Sunday.

```
Switch(Config-Time-Range-admin_timer)#periodic Monday Wednesday Friday Sunday 14:30:00 to 16:45:00
```

## 1.2 absolute start

**Command:** [no] absolute start <start\_time> <start\_data> [end <end\_time> <end\_data>]

**Functions:** Define an absolute time-range, this time-range operates subject to the clock of this equipment.

**Parameters:** *start\_time* : start time, HH:MM:SS (hour: minute: second)

*end\_time* : end time, HH:MM:SS (hour: minute: second)

*start\_data* : start data, the format is, YYYY.MM.DD (year.month.day)

*end\_data* : end data, the format is, YYYY.MM.DD (year.month.day)

Remark: time-range is one minute per time, so the time error shall be <= one minute.

**Command Mode:** Time-range mode

**Default:** No time-range configuration.

**Usage Guide:** Absolute time and date, assign specific year, month, day, hour, minute of the start, shall not configure multiple absolute time and date, when in repeated configuration, the latter configuration covers the absolute time and date of the former configuration.

**Examples:** Make configurations effective from 6:00:00 to 13:30:00 from Oct. 1, 2004 to Jan. 26, 2005.

```
Switch(config)#Time-range admin_timer
```

```
Switch(Config-Time-Range-admin_timer)#absolute start 6:00:00 2004.10.1 end 13:30:00 2005.1.26
```

## 1.3 access-list deny-preemption

This command is not supported by the switch.

## 1.4 access-list (ip extended)

Command: `access-list <num> {deny | permit} icmp {{<slpAddr> <sMask>} | any-source | {host-source <slpAddr>}} {{<dIpAddr> <dMask>} | any-destination | {host-destination <dIpAddr>}} [<icmp-type> [<icmp-code>]] [precedence <prec>] [tos <tos>][time-range<time-range-name>]`

`access-list <num> {deny | permit} igmp {{<slpAddr> <sMask>} | any-source | {host-source <slpAddr>}} {{<dIpAddr> <dMask>} | any-destination | {host-destination <dIpAddr>}} [<igmp-type>] [precedence <prec>] [tos <tos>][time-range<time-range-name>]`

`access-list <num> {deny | permit} tcp {{ <slpAddr> <sMask> } | any-source | {host-source <slpAddr> }} [s-port { <sPort> | range <sPortMin> <sPortMax> } ] {{ <dIpAddr> <dMask> } | any-destination | {host-destination <dIpAddr> }} [d-port { <dPort> | range <dPortMin> <dPortMax> } ] [ack+ fin+ psh+ rst+ urg+ syn] [precedence <prec> ] [tos <tos> ] [time-range <time-range-name> ]`

`access-list <num> {deny / permit} udp {{ <slpAddr> <sMask> } | any-source | {host-source <slpAddr> }} [s-port { <sPort> | range <sPortMin> <sPortMax> } ] {{ <dIpAddr> <dMask> } | any-destination | {host-destination <dIpAddr> }} [d-port { <dPort> / range <dPortMin> <dPortMax> } ] [precedence <prec> ] [tos <tos> ] [time-range<time-range-name> ]`

`access-list <num> {deny / permit} {eigrp | gre / igrp / ipinip | ip | ospf | <protocol-num> } {{ <slpAddr> <sMask> } / any-source / {host-source <slpAddr> }} {{ <dIpAddr> <dMask> } | any-destination / {host-destination <dIpAddr> }} [precedence <prec> ] [tos <tos> ] [time-range <time-range-name> ]`

`no access-list <num>`

**Functions:** Create a numeric extended IP access rule to match specific IP protocol or all IP protocol; if access-list of this coded numeric extended does not exist, thus to create such a access-list.

**Parameters:** `<num>` is the No. of access-list, 100-299; `<protocol>` is the No. of upper-layer protocol of ip, 0-255; `<slpAddr>` is the source IP address, the format is dotted decimal notation; `<sMask>` is the reverse mask of source IP, the format is dotted decimal notation; `<dIpAddr>` is the destination IP address, the format is dotted decimal notation; `<dMask>` is the reverse mask of destination IP, the format is dotted decimal notation,

attentive position 0, ignored position1; **<igmp-type>**, the type of igmp, 0-15; **<icmp-type>**, the type of icmp, 0-255; **<icmp-code>**, protocol No. of icmp, 0-255; **<prec>**, IP priority, 0-7; **<tos>**, to value, 0-15; **<sPort>**, source port No., 0-65535; **<sPortMin>**, the down boundary of source port; **<sPortMax>**, the up boundary of source port; **<dPortMin>**, the down boundary of destination port; **<dPortMax>**, the up boundary of destination port; **<dPort>**, destination port No., 0-65535; **<time-range-name>**, the name of time-range.

**Command Mode:** Global mode

**Default:** No access-lists configured.

**Usage Guide:** When the user assign specific **<num>** for the first time, ACL of the serial number is created, then the lists are added into this ACL; the access list which marked 200-299 can configure not continual reverse mask of IP address.

**<igmp-type>** represent the type of IGMP packet, and usual values please refer to the following description:

17(0x11): IGMP QUERY packet

18(0x12): IGMP V1 REPORT packet

22(0x16): IGMP V2 REPORT packet

23(0x17): IGMP V2 LEAVE packet

34(0x22): IGMP V3 REPORT packet

19(0x13): DVMR packet

20(0x14): PIM V1 packet

**Particular notice:** The packet types included here are not the types excluding IP OPTION. Normally, IGMP packet contains OPTION fields, and such configuration is of no use for this type of packet. If you want to configure the packets containing OPTION, please directly use the manner where OFFSET is configured.

**Examples:** Create the numeric extended access-list whose serial No. is 110. deny icmp packet to pass, and permit udp packet with destination address 192. 168. 0. 1 and destination port 32 to pass.

```
Switch(config)#access-list 110 deny icmp any any-destination
```

```
Switch(config)#access-list 110 permit udp any host-destination 192.168.0.1 d-port 32
```

## 1.5 access-list (ip standard)

**Command:** `access-list <num> {deny | permit} {{<slpAddr> <sMask >} | any-source| {host-source <slpAddr>}}`

`no access-list <num>`

**Functions:** Create a numeric standard IP access-list. If this access-list exists, then add a rule list; the “no access-list <num>” operation of this command is to delete a numeric standard IP access-list.

**Parameters:** **<num>** is the No. of access-list, 100-199; **<slpAddr>** is the source IP address, the format is dotted decimal notation; **<sMask>** is the reverse mask of source IP, the format is dotted decimal notation.

**Command Mode:** Global mode

**Default:** No access-lists configured.

**Usage Guide:** When the user assign specific **<num>** for the first time, ACL of the serial number is created, then the lists are added into this ACL.

**Examples:** Create a numeric standard IP access-list whose serial No. is 20, and permit date packets with source address of 10.1.1.0/24 to pass, and deny other packets with source address of 10.1.1.0/16.

```
Switch(config)#access-list 20 permit 10.1.1.0 0.0.0.255
```

```
Switch(config)#access-list 20 deny 10.1.1.0 0.0.255.255
```

## 1.6 access-list(mac extended)

**Command:** **access-list <num> {deny | permit} {any-source-mac | {host-source-mac <host\_smac>} | {<smac> <smac-mask>}} {any-destination-mac | {host-destination-mac <host\_dmac>} | {<dmac> <dmac-mask>}} [untagged-eth2 | tagged-eth2 | untagged-802-3 | tagged-802-3]**  
**no access-list <num>**

**Functions:** Define an extended numeric MAC ACL rule, “**no access-list <num>**” command deletes an extended numeric MAC access-list rule.

**Parameters:** **<num>** is the access-list No. which is a decimal's No. from 1100-1199; **deny** if rules are matching, deny access; **permit** if rules are matching, permit access; **<any-source-mac>** any source address; **<any-destination-mac>** any destination address; **<host\_smac>**, **<smac>** source MAC address; **<smac-mask>** mask (reverse mask) of source MAC address; **<host\_dmac>** , **<dmac>** destination MAC address; **<dmac-mask>** mask (reverse mask) of destination MAC address; **untagged-eth2** format of untagged ethernet II packet; **tagged-eth2** format of tagged ethernet II packet; **untagged-802-3** format of untagged ethernet 802.3 packet; **tagged-802-3** format of tagged ethernet 802.3 packet.

**Command Mode:** Global mode

**Default Configuration:** No access-list configured

**Usage Guide:** When the user assign specific **<num>** for the first time, ACL of the serial number is created, then the lists are added into this ACL.

**Examples:** Permit tagged-eth2 with any source MAC addresses and any destination MAC addresses and the packets pass.

```
Switch(config)#access-list 1100 permit any-source-mac any-destination-mac tagged-eth2
```

## 1.7 access-list(mac-ip extended)

Command:

```

access-list<num>{deny|permit}{any-source-mac|
{host-source-mac<host_smac>}{<smac><smac-mask>}}
{any-destination-mac|{host-destination-mac
<host_dmac>}{<dmac><dmac-mask>}}icmp
{{<source><source-wildcard>}any-source|{host-source<source-host-ip>}}
{{<destination><destination-wildcard>}any-destination|
{host-destination<destination-host-ip>}}[<icmp-type> [<icmp-code>]] [precedence
<precedence>] [tos <tos>][time-range<time-range-name>]
access-list<num>{deny|permit}{any-source-mac|
{host-source-mac<host_smac>}{<smac><smac-mask>}}
{any-destination-mac|{host-destination-mac
<host_dmac>}{<dmac><dmac-mask>}}igmp
{{<source><source-wildcard>}any-source|{host-source<source-host-ip>}}
{{<destination><destination-wildcard>}any-destination|
{host-destination<destination-host-ip>}} [<igmp-type>] [precedence <precedence>]
[tos <tos>][time-range<time-range-name>]
access-list <num> {deny|permit}{any-source-mac| {host-source-mac
<host_smac> }}{ <smac> <smac-mask> }}{any-destination-mac|
{host-destination-mac <host_dmac> }}{ <dmac> <dmac-mask> }}tcp {{ <source>
<source-wildcard> }|any-source| {host-source <source-host-ip> }}[s-port{ <port1> |
range <sPortMin> <sPortMax> }] {{ <destination> <destination-wildcard> } |
any-destination | {host-destination <destination-host-ip> }} [d-port { <port3> | range
<dPortMin> <dPortMax> }] [ack+fin+psh+rst+urg+syn] [precedence
<precedence> ] [tos <tos> ] [time-range <time-range-name> ]
access-list <num> {deny|permit}{any-source-mac| {host-source-mac
<host_smac> }}{ <smac> <smac-mask> }}{any-destination-mac|
{host-destination-mac <host_dmac> }}{ <dmac> <dmac-mask> }}udp {{ <source>
<source-wildcard> }|any-source| {host-source <source-host-ip> }}[s-port{ <port1> |
range <sPortMin> <sPortMax> }] {{ <destination>
<destination-wildcard> }|any-destination/ {host-destination
<destination-host-ip> }}[d-port{ <port3> | range <dPortMin> <dPortMax> }]
[precedence <precedence> ] [tos <tos> ] [time-range <time-range-name> ]

```

**Functions:** Define an extended numeric MAC-IP ACL rule, no command deletes a extended numeric MAC-IP ACL access-list rule.

**Parameters:** **num** access-list serial No. this is a decimal's No. from 3100-3299; **deny** if rules are matching, deny to access; **permit** if rules are matching, permit to access; **any-source-mac**: any source MAC address; **any-destination-mac**: any destination MAC address; **host\_smac** , **smac**: source MAC address; **smac-mask**: **mask** (reverse mask) of source MAC address ; **host\_dmac** , **dmas** destination MAC address; **dmac-mask** mask (reverse mask) of destination MAC address; **protocol** No. of name or IP protocol. It can be a key word: eigrp, gre, icmp, igmp, igrp, ip, ipinip, ospf, tcp, or udp, or an integer from 0-255 of list No. of IP address. Use key word 'ip' to match all Internet protocols (including ICMP, TCP, AND UDP) list; **source-host-ip**, **source** No. of source network or source host of packet delivery. Numbers of 32-bit binary system with dotted decimal notation expression; host: means the address is the IP address of source host, otherwise the IP address of network; **source-wildcard**: reverse of source IP. Numbers of 32-bit binary system expressed by decimal's numbers with four-point separated, reverse mask; **destination-host-ip**, destination No. of destination network or host to which packets are delivered. Numbers of 32-bit binary system with dotted decimal notation expression; **host**: means the address is the that the destination host address, otherwise the network IP address; **destination-wildcard**: mask of destination. I Numbers of 32-bit binary system expressed by decimal's numbers with four-point separated, reverse mask; **s-port(optional)**: means the need to match TCP/UDP source port; **port1(optional)**: value of TCP/UDP source interface No., Interface No. is an integer from 0-65535; **d-port(optional)**: means need to match TCP/UDP destination interface; **<sPortMin>**, the down boundary of source port; **<sPortMax>**, the up boundary of source port; **port3(optional)**: value of TCP/UDP destination interface No., Interface No. is an integer from 0-65535; **<dPortMin>**, the down boundary of destination port; **<dPortMax>**, the up boundary of destination port; **[ack] [fin] [psh] [rst] [urg] [syn]**, (optional) only for TCP protocol, multi-choices of tag positions are available, and when TCP data reports the configuration of corresponding position, then initialization of TCP data report is enabled to form a match when in connection; **precedence** (optional) packets can be filtered by priority which is a number from 0-7; **tos** (optional) packets can be filtered by service type which ia number from 0-15; **icmp-type** (optional) ICMP packets can be filtered by packet type which is a number from 0-255; **icmp-code** (optional) ICMP packets can be filtered by packet code which is a number from 0-255; **igmp-type** (optional) ICMP packets can be

filtered by IGMP packet name or packet type which is a number from 0-255;  
**<time-range-name>**, name of time range

**Command Mode:** Global mode

**Default Configuration:** No access-list configured.

**Usage Guide:** When the user assign specific <num> for the first time, ACL of the serial number is created, then the lists are added into this ACL; the access list which marked 3200-3299 can configure not continual reverse mask of IP address.

**Examples:** Permit the passage of TCP packet with source MAC 00-12-34-45-XX-XX, any destination MAC address, source IP address 100.1.1.0 0.255.255.255, and source port 100.

```
Switch(config)#access-list 3199 permit 00-12-34-45-67-00 00-00-00-00-FF-FF
any-destination-mac tcp 100.1.1.0 0.255.255.255 s-port 100 any-destination
```

## 1.8 access-list(mac standard)

**Command:** `access-list <num> {deny|permit} {any-source-mac | {host-source-mac <host_smac> } | {<smac> <smac-mask> } }`

`no access-list <num>`

**Functions:** Define a standard numeric MAC ACL rule, no command deletes a standard numeric MAC ACL access-list rule.

**Parameters:** **<num>** is the access-list No. which is a decimal's No. from 700-799; **deny** if rules are matching, deny access; **permit** if rules are matching, permit access; **<host\_smac>**, **<sumac>** source MAC address; **<sumac-mask>** mask (reverse mask) of source MAC address.

**Command Mode:** Global mode

**Default Configuration:** No access-list configured.

**Usage Guide:** When the user assign specific <num> for the first time, ACL of the serial number is created, then the lists are added into this ACL.

**Examples:** Permit the passage of packets with source MAC address 00-00-XX-XX-00-01, and deny passage of packets with source MAC address 00-00-00-XX-00-ab.

```
Switch(config)# access-list 700 permit 00-00-00-00-00-01 00-00-FF-FF-00-00
```

```
Switch(config)# access-list 700 deny 00-00-00-00-00-ab 00-00-00-FF-00-00
```

## 1.9 clear access-group statistic

**Command:** `clear access-group statistic [ethernet <interface-name> ]`

**Functions:** Empty packet statistics information of the specified interface.

**Parameters:** *<interface-name>*: Interface name.

**Command Mode:** Admin mode

**Default:** None

**Examples:** Empty packet statistics information of interface.

```
Switch#clear access-group statistic
```

## 1.10 firewall

**Command:** `firewall {enable | disable}`

**Functions:** Enable or disable firewall.

**Parameters:** **enable** means to enable of firewall; **disable** means to disable firewall.

**Default:** It is no use if default is firewall.

**Command Mode:** Global mode

**Usage Guide:** Whether enabling or disabling firewall, access rules can be configured. But only when the firewall is enabled, the rules can be used in specific orientations of specific ports. When disabling the firewall, all ACL tied to ports will be deleted.

**Examples:** Enable firewall.

```
Switch(config)#firewall enable
```

## 1.11 ip access extended

**Command:** `ip access extended <name>`

`no ip access extended <name>`

**Function:** Create a named extended IP access list. The no prefix will remove the named extended IP access list including all the rules.

**Parameters:** *<name>* is the name of the access list. The name can be formed by non-all-digit characters of length of 1 to 32.

**Command Mode:** Global Mode.

**Default:** No access list is configured by default.

**Usage Guide:** When this command is issued for the first time, an empty access list will be created.

**Example:** To create a extended IP access list name tcpFlow.

```
Switch(config)#ip access-list extended tcpFlow
```

## 1.12 ip access standard

**Command:** `ip access standard <name>`

**no ip access standard <name>**

**Function:** Create a named standard access list. The no prefix will remove the named standard access list including all the rules in the list.

**Parameters:** <name> is the name of the access list. The name can be formed by non-all-digit characters of length of 1 to 32.

**Command Mode:** Global Mode.

**Default:** No access list is configured by default.

**Usage Guide:** When this command is issued for the first time, an empty access list will be created.

**Example:** To create a standard IP access list name ipFlow.

```
Switch(config)#ip access-list standard ipFlow
```

## 1.13 ipv6 access-list

**Command:** `ipv6 access-list <num-std> {deny | permit} {<slPv6Prefix/sPrefixlen> | any-source | {host-source <slPv6Addr>}}`

**no ipv6 access-list <num-std>**

**Functions:** Creates a numbered standard IP access-list, if the access-list already exists, then a rule will add to the current access-list; the “no access-list {<num-std>|<num-ext>}” command deletes a numbered standard IP access-list.

**Parameters:** <num-std> is the list number, list range is between 500 ~ 599; <slPv6Prefix> is the prefix of the ipv6 source address; <sPrefixlen> is the length of prefix of the ipv6 source address, range is between 1~128; <slPv6Addr> is the ipv6 source address.

**Command Mode:** Global Mode.

**Default:** No access-list configured.

**Usage Guide:** Creates a numbered 520 standard IP access-list first time, the following configuration will add to the current access-list.

**Examples:** Creates a numbered 520 standard IP access-list, allow the source packet from 2003:1:2:3::1/64 pass through the net, and deny all the other packet from the source address 2003:1:2::1/48 pass through.

```
Switch (config)#ipv6 access-list 520 permit 2003:1:2:3::1/64
```

```
Switch (config)#ipv6 access-list 520 deny 2003:1:2::1/48
```

## 1.14 ipv6 access standard

**Command:** `ipv6 access-list standard <name>`

**no ipv6 access-list standard <name>**

**Function:** Create a name-based standard IPv6 access list; the “**no ipv6 access-list standard<name>**” command deletes the name-based standard IPv6 access list (including all entries).

**Parameter:** **<name>** is the name for access list, the character string length is from 1 to 32.

**Command Mode:** Global Mode.

**Default:** No access list is configured by default.

**Usage Guide:** When this command is run for the first time, only an empty access list with no entry will be created.

**Example:** Create a standard IPv6 access list named ip6Flow.

```
Switch(config)#ipv6 access-list standard ip6Flow
```

## 1.15 ipv6 access extended

**Command:** **ipv6 access-list extended <name>**

**no ipv6 access-list extended <name>**

**Function:** Create a name-based extended IPv6 access list; the no command delete the name-based extended IPv6 access list.

**Parameter:** **<name>** is the name for access list, the character string length is from 1 to 32.

**Command Mode:** Global Mode.

**Default:** No IP address is configured by default.

**Usage Guide:** When this command is run for the first time, only an empty access list with no entry will be created.

**Example:** Create an extensive IPv6 access list named tcpFlow.

```
Switch (config)#ipv6 access-list extended tcpFlow
```

## 1.16 {ip|ipv6|mac|mac-ip} access-group

**Command:** **{ip|ipv6|mac|mac-ip} access-group <name> {in} [traffic-statistic]**

**no {ip|ipv6|mac|mac-ip} access-group <name> {in}**

**Function:** Apply an access-list on some direction of port, and determine if ACL rule is added statistic counter or not by options; the no command deletes access-list binding on the port.

**Parameter:** **<name>** is the name for access list, the character string length is from 1 to 32.

**Command Mode:** Port Mode

**Default:** The entry of port is not bound ACL.

**Usage Guide:** One port can bind ingress rules

**Note:** when a ACL has multiple rules, traffic-statistic can't configure.

There are four kinds of packet head field based on concerned: MAC ACL, IP ACL, MAC-IP ACL and IPv6 ACL; to some extent, ACL filter behavior (permit, deny) has a conflict when a data packet matches multi types of four ACLs. The strict priorities are specified for each ACL based on outcome veracity. It can determine final behavior of packet filter through priority when the filter behavior has a conflict.

When binding ACL to port, there are some limits as below:

1. Each port can bind a MAC-IP ACL, a IP ACL, a MAC ACL and a IPv6 ACL.

2. When binding four ACLs and data packet matching the multi ACLs simultaneity, the priority from high to low are shown as below,

Ingress IPv6 ACL

Ingress MAC-IP ACL

Ingress MAC ACL

Ingress IP ACL

**Example:** Binding AAA access-list to entry direction of port.

```
Switch(Config-If-Ethernet1/0/5)#ip access-group aaa in
```

## 1.17 {ip|ipv6|mac|mac-ip} access-group (Interface Mode)

This command is not supported by switch.

## 1.18 mac access extended

**Command:** mac-access-list extended <name>

no mac-access-list extended <name>

**Functions:** Define a name-manner MAC ACL or enter access-list configuration mode, “no mac-access-list extended <name>” command deletes this ACL.

**Parameters:** <name> name of access-list excluding blank or quotation mark, and it must start with letter, and the length cannot exceed 32. (remark: sensitivity on capital or small letter.)

**Command Mode:** Global mode

**Default Configuration:** No access-lists configured.

**Usage Guide:** After assigning this command for the first time, only an empty name

access-list is created and no list item included.

**Examples:** Create an MAC ACL named mac\_acl.

```
Switch(config)# mac-access-list extended mac_acl
```

```
Switch(Config-Mac-Ext-Nacl-mac_acl)#
```

## 1.19 mac-ip access extended

**Command:** mac-ip-access-list extended <name>

**no mac-ip-access-list extended <name>**

**Functions:** Define a name-manner MAC-IP ACL or enter access-list configuration mode, “no mac-ip-access-list extended <name>” command deletes this ACL.

**Parameters:** <name>: name of access-list excluding blank or quotation mark, and it must start with letter, and the length cannot exceed 32 (remark: sensitivity on capital or small letter).

**Command Mode:** Global Mode.

**Default:** No named MAC-IP access-list.

**Usage Guide:** After assigning this command for the first time, only an empty name access-list is created and no list item included.

**Examples:** Create an MAC-IP ACL named macip\_acl.

```
Switch(config)# mac-ip-access-list extended macip_acl
```

```
Switch(Config-MacIp-Ext-Nacl-macip_acl)#
```

## 1.20 permit | deny (ip extended)

**Command:** [no] {deny | permit} icmp {{<slpAddr> <sMask>} | any-source | {host-source <slpAddr>}} {{<dIpAddr> <dMask>} | any-destination | {host-destination <dIpAddr>}} [<icmp-type> [<icmp-code>]] [precedence <prec>] [tos <tos>][time-range<time-range-name>]

[no] {deny | permit} igmp {{<slpAddr> <sMask>} | any-source | {host-source <slpAddr>}} {{<dIpAddr> <dMask>} | any-destination | {host-destination <dIpAddr>}} [<igmp-type>] [precedence <prec>] [tos <tos>][time-range<time-range-name>]

[no] {deny | permit} tcp {{ <slpAddr> <sMask> } | any-source | {host-source <slpAddr> } } [s-port { <sPort> | range <sPortMin> <sPortMax> } ] {{ <dIpAddr> <dMask> } | any-destination | {host-destination <dIpAddr> } } [d-port { <dPort> | range <dPortMin> <dPortMax> } ] [ack+fin+psh+rst+urg+syn] [precedence <prec> ] [tos <tos> ][time-range <time-range-name> ]

[no] {deny | permit} udp {{ <slpAddr> <sMask> } | any-source | {host-source

```
<slpAddr> }} [s-port { <sPort> | range <sPortMin> <sPortMax> }] {{ <dIpAddr>
<dMask> } | any-destination | {host-destination <dIpAddr> }} [d-port { <dPort> |
range <dPortMin> <dPortMax> }] [precedence <prec> ] [tos
<tos> ][time-range<time-range-name> ]
```

```
[no] {deny | permit} {eigrp | gre | igmp | ipinip | ip | ospf | <protocol-num>}
{{<slpAddr> <sMask>} | any-source | {host-source <slpAddr>}} {{<dIpAddr>
<dMask>} | any-destination | {host-destination <dIpAddr>}} [precedence <prec>]
[tos <tos>][time-range<time-range-name>]
```

**Functions:** Create a name extended IP access rule to match specific IP protocol or all IP protocol.

**Parameters:** **<slpAddr>** is the source IP address, the format is dotted decimal notation; **<sMask >** is the reverse mask of source IP, the format is dotted decimal notation; **<dIpAddr>** is the destination IP address, the format is dotted decimal notation; **<dMask>** is the reverse mask of destination IP, the format is dotted decimal notation, attentive position 0, ignored position 1; **<igmp-type>**, the type of igmp, 0-15; **<icmp-type>**, the type of icmp, 0-255 ; **<icmp-code>**, protocol No. of icmp, 0-255; **<prec>**, IP priority, 0-7; **<tos>**, to value, 0-15; **<sPort>**, source port No., 0-65535; **<sPortMin>**, the down boundary of source port; **<sPortMax>**, the up boundary of source port; **<dPort>**, destination port No. 0-65535; **<dPortMin>**, the down boundary of destination port; **<dPortMax>**, the up boundary of destination port; **<time-range-name>**, time range name.

**Command Mode:** Name extended IP access-list configuration mode

**Default:** No access-list configured.

**Examples:** Create the extended access-list, deny icmp packet to pass, and permit udp packet with destination address 192. 168. 0. 1 and destination port 32 to pass.

```
Switch(config)# access-list ip extended udpFlow
```

```
Switch(Config-IP-Ext-Nacl-udpFlow)#deny igmp any any-destination
```

```
Switch(Config-IP-Ext-Nacl-udpFlow)#permit udp any host-destination 192.168.0.1 d-port
32
```

## 1.21 permit | deny(ip standard)

```
Command: {deny | permit} {{<slpAddr> <sMask>} | any-source | {host-source
<slpAddr>}}
```

```
no {deny | permit} {{<slpAddr> <sMask>} | any-source | {host-source
<slpAddr>}}
```

**Functions:** Create a name standard IP access rule, and “no {deny | permit} {{<slpAddr> <sMask>} | any-source | {host-source <slpAddr>}}” action of this

command deletes this name standard IP access rule.

**Parameters:** *<slpAddr>* is the source IP address, the format is dotted decimal notation; *<sMask>* is the reverse mask of source IP, the format is dotted decimal notation.

**Command Mode:** Name standard IP access-list configuration mode

**Default:** No access-list configured.

**Example:** Permit packets with source address 10.1.1.0/24 to pass, and deny other packets with source address 10.1.1.0/16.

```
Switch(config)# access-list ip standard ipFlow
```

```
Switch(Config-Std-Nacl-ipFlow)# permit 10.1.1.0 0.0.0.255
```

```
Switch(Config-Std-Nacl-ipFlow)# deny 10.1.1.0 0.0.255.255
```

## 1.22 permit | deny(ipv6 extended)

**Command:** [no] {deny | permit} icmp {{<slPv6Prefix/sPrefixlen>} | any-source | {host-source <slPv6Addr>}} {<dIPv6Prefix/dPrefixlen> | any-destination | {host-destination <dIPv6Addr>}} [<icmp-type> [<icmp-code>]] [dscp <dscp>] [flow-label <fl>][time-range <time-range-name>]

[no] {deny | permit} tcp { <slPv6Prefix/sPrefixlen> | any-source | {host-source <slPv6Addr> } } [s-port { <sPort> | range <sPortMin> <sPortMax> } ] { <dIPv6Prefix/dPrefixlen> | any-destination | {host-destination <dIPv6Addr> } } [d-port { <dPort> | range <dPortMin> <dPortMax> } ] [syn | ack | urg | rst | fin | psh] [dscp <dscp> ] [flow-label <fl> ][time-range <time-range-name> ]

[no] {deny | permit} udp { <slPv6Prefix/sPrefixlen> | any-source | {host-source <slPv6Addr> } } [s-port { <sPort> | range <sPortMin> <sPortMax> } ] { <dIPv6Prefix/dPrefixlen> | any-destination | {host-destination <dIPv6Addr> } } [d-port { <dPort> | range <dPortMin> <dPortMax> } ] [dscp <dscp> ] [flow-label <fl> ][time-range <time-range-name> ]

[no] {deny | permit} <next-header> {<slPv6Prefix/sPrefixlen> | any-source | {host-source <slPv6Addr>}} {<dIPv6Prefix/dPrefixlen> | any-destination | {host-destination <dIPv6Addr>}} [dscp <dscp>] [flow-label <fl>][time-range <time-range-name>]

[no] {deny | permit} {<slPv6Prefix/sPrefixlen> | any-source | {host-source <slPv6Addr>}} {<dIPv6Prefix/dPrefixlen> | any-destination | {host-destination <dIPv6Addr>}} [dscp <dscp>] [flow-label <fl>] [time-range<time-range-name>]

**Function:** Create an *extended* nomenclature IPv6 access control rule for specific IPv6 protocol.

**Parameter:** *<slPv6Addr>* is the source IPv6 address; *<sPrefixlen>* is the length of the IPv6 address prefix, the range is 1~128; *<dIPv6Addr>* is the destination IPv6 address;

**<dPrefixlen>** is the length of the IPv6 address prefix, the range is 1~128; **<igmp-type>**, type of the IGMP; **<icmp-type>**, icmp type; **<icmp-code>**, icmp protocol number; **<dscp>**, IPv6 priority, the range is 0~63; **<flowlabel>**, value of the flow label, the range is 0~1048575; **syn,ack,urg,rst,fin,psh,tcp** label position; **<sPort>**, source port number, the range is 0~65535; **<sPortMin>**, the down boundary of source port; **<sPortMax>**, the up boundary of source port; **<dPort>**, destination port number, the range is 0~65535; **<dPortMin>**, the down boundary of destination port; **<dPortMax>**, the up boundary of destination port. **<next-header>**, the IPv6 next-header. **<time-range-name>**, time range name.

**Command Mode:** IPv6 nomenclature extended access control list mode

**Default:** No access control list configured.

**Example:** Create an extended access control list named udpFlow, denying the igmp packets while allowing udp packets with destination address 2001:1:2:3::1 and destination port 32.

```
Switch(config)#ipv6 access-list extended udpFlow
Switch(Config-IPv6-Ext-Nacl-udpFlow)#deny igmp any any-destination
Switch(Config-IPv6-Ext-Nacl-udpFlow)#permit udp any-source host-destination
2001:1:2:3::1 dPort 32
```

## 1.23 permit | deny(ipv6 standard)

**Command:** [no] {deny | permit} {{<sIPv6Prefix/sPrefixlen>} | any-source | {host-source <sIPv6Addr>}}

**Function:** Create a standard nomenclature IPv6 access control rule; the no form of this command deletes the nomenclature standard IPv6 access control rule.

**Parameter:** **<sIPv6Prefix>** is the prefix of the source IPv6 address, **<sPrefixlen>** is the length of the IPv6 address prefix, the valid range is 1~128. **<sIPv6Addr>** is the source IPv6 address.

**Command Mode:** Standard IPv6 nomenclature access list mode

**Default:** No access list configured by default.

**Usage Guide:**

**Example:** Permit packets with source address of 2001:1:2:3::1/64 while denying those with source address of 2001:1:2:3::1/48.

```
Switch(config)#ipv6 access-list standard ipv6Flow
Switch(Config-IPv6-Std-Nacl-ipv6Flow)# permit 2001:1:2:3::1/64
Switch(Config-IPv6-Std-Nacl-ipv6Flow)# deny 2001:1:2:3::1/48
```

## 1.24 permit | deny(mac extended)

Command:

```
[no]{deny|permit} {any-source-mac}{host-source-mac <host_smac> }{{ <smac>
<smac-mask>          }}          {any-destination-mac}{host-destination-mac
<host_dmac> }{{ <dmac> <dmac-mask> }} [cos <cos-val> [ <cos-bitmask> ]]
[vlanId <vid-value> [ <vid-mask> ]] [ethertype <protocol> [ <protocol-mask> ]]
```

```
[no]{deny|permit} {any-source-mac}{host-source-mac <host_smac> }{{ <smac>
<smac-mask>          }}          {any-destination-mac}{host-destination-mac
<host_dmac> }{{ <dmac> <dmac-mask> }} [untagged-eth2 [ethertype <protocol>
[protocol-mask]]]
```

```
[no]{deny|permit}{any-source-mac}{host-source-mac <host_smac> }{{ <smac>
<smac-mask>          }}          {any-destination-mac}{host-destination-mac
<host_dmac> }{{ <dmac> <dmac-mask> }} [untagged-802-3]
```

```
[no]{deny|permit} {any-source-mac}{host-source-mac <host_smac> }{{ <smac>
<smac-mask>          }}          {any-destination-mac}{host-destination-mac
<host_dmac> }{{ <dmac> <dmac-mask> }} [tagged-eth2 [cos <cos-val>
[ <cos-bitmask> ]] [vlanId <vid-value> [ <vid-mask> ]]] [ethertype <protocol>
[ <protocol-mask> ]]
```

```
[no]{deny|permit}{any-source-mac}{host-source-mac <host_smac> }{{ <smac>
<smac-mask>          }}          {any-destination-mac}{host-destination-mac
<host_dmac> }{{ <dmac> <dmac-mask> }} [tagged-802-3 [cos <cos-val>
[ <cos-bitmask> ]]] [vlanId <vid-value> [ <vid-mask> ]]]]
```

**Functions:** Define an extended name MAC ACL rule, and no command deletes this extended name IP access rule.

**Parameters:** **any-source-mac:** any source of MAC address; **any-destination-mac:** any destination of MAC address; **host\_smac**, **smac:** source MAC address; **smac-mask:** mask (reverse mask) of source MAC address; **host\_dmac**, **dmas** destination MAC address; **dmac-mask** mask (reverse mask) of destination MAC address; **untagged-eth2** format of untagged ethernet II packet; **tagged-eth2** format of tagged ethernet II packet; **untagged-802-3** format of untagged ethernet 802.3 packet; **tagged-802-3** format of tagged ethernet 802.3 packet; **cos-val:** cos value, 0-7; **cos-bitmask:** cos mask, 0-7reverse mask and mask bit is consecutive; **vid-value:** VLAN No, 1-4094; **vid-bitmask:** VLAN mask, 0-4095, reverse mask and mask bit is consecutive; **protocol:** specific

Ethernet protocol No., 1536-65535; **protocol-bitmask**: protocol mask, 0-65535, reverse mask and mask bit is consecutive.

**Notice:** mask bit is consecutive means the effective bit must be consecutively effective from the first bit on the left, no ineffective bit can be added through. For example: the reverse mask format of one byte is: 00001111b; mask format is 11110000; and this is not permitted: 00010011.

**Command Mode:** Name extended MAC access-list configuration mode

**Default configuration:** No access-list configured.

**Example:** The forward source MAC address is not permitted as 00-12-11-23-XX-XX of 802.3 data packet.

```
Switch(config)# mac-access-list extended macExt
```

```
Switch(Config-Mac-Ext-Nacl-macExt)#deny    00-12-11-23-00-00    00-00-00-00-ff-ff
any-destination-mac untagged-802-3
```

```
Switch(Config-Mac-Ext-Nacl-macExt)#deny    00-12-11-23-00-00    00-00-00-00-ff-ff    any
tagged-802
```

## 1.25 permit | deny(mac-ip extended)

**Command:**

```
[no]                                     {deny|permit}
{any-source-mac|{host-source-mac<host_smac>|{<smac><smac-mask>}}
{any-destination-mac|{host-destination-mac<host_dmac>|{<dmac><dmac-mask>}}
icmp{{<source><source-wildcard>}|any-source|{host-source<source-host-ip>}}
{{<destination><destination-wildcard>}|any-destination|{host-destination
<destination-host-ip>}} [<icmp-type> [<icmp-code>]] [precedence <precedence>]
[<tos <tos>]][time-range<time-range-name>]
```

```
[no]{deny|permit}
{any-source-mac|{host-source-mac<host_smac>|{<smac><smac-mask>}}
{any-destination-mac|{host-destination-mac<host_dmac>|{<dmac><dmac-mask>}}
igmp{{<source><source-wildcard>}|any-source| {host-source<source-host-ip>}}
{{<destination><destination-wildcard>}|any-destination|{host-destination
<destination-host-ip>}} [<igmp-type>] [precedence <precedence>] [tos
<tos>]][time-range<time-range-name>]
```

```
[no]{deny|permit}{any-source-mac|{host-source-mac <host_smac> }| { <smac>
<smac-mask>
}}{any-destination-mac|{host-destination-mac
<host_dmac> }}{ <dmac> <dmac-mask> }}tcp{{ <source>
```

```
<source-wildcard> }|any-source| {host-source <source-host-ip> }}[s-port { <port1> |
range <sPortMin> <sPortMax> }] {{ <destination> <destination-wildcard> } |
any-destination| {host-destination <destination-host-ip> }} [d-port { <port3> | range
<dPortMin> <dPortMax> }] [ack + fin + psh + rst + urg + syn] [precedence
<precedence> ] [tos <tos> ][time-range <time-range-name> ]
```

```
[no]{deny|permit}{any-source-mac}{host-source-mac <host_smac> }{{ <smac>
<smac-mask> }}{any-destination-mac}{host-destination-mac <host_dmac> }|
{ <dmac> <dmac-mask> }}udp{{ <source> <source-wildcard> }|any-source|
{host-source <source-host-ip> }}[s-port{ <port1> | range <sPortMin> <sPortMax> }]
{{ <destination> <destination-wildcard> }|any-destination| {host-destination
<destination-host-ip> }} [d-port { <port3> / range <dPortMin> <dPortMax> }]
[precedence <precedence> ] [tos <tos> ][time-range <time-range-name> ]
```

```
[no]{deny|permit}{any-source-mac}{host-source-mac<host_smac>}|{<smac>
<smac-mask>}}{any-destination-mac}{host-destination-mac<host_dmac>}|
{<dmac><dmac-mask>}}{eigrp|gre|igrp|ip|ipinip|ospf}{<protocol-num>}}
{{<source><source-wildcard>}|any-source|{host-source<source-host-ip>}}
{{<destination><destination-wildcard>}|any-destination|{host-destination
<destination-host-ip>}} [precedence <precedence>] [tos
<tos>][time-range<time-range-name>]
```

**Functions:** Define an extended name MAC-IP ACL rule, no form deletes one extended numeric MAC-IP ACL access-list rule.

**Parameters:** **num** access-list serial No. this is a decimal's No. from 3100-3199; **deny** if rules are matching, deny to access; **permit** if rules are matching, permit to access; **any-source-mac**: any source MAC address; **any-destination-mac**: any destination MAC address; **host\_smac**, **smac**: source MAC address; **smac-mask**: mask (reverse mask) of source MAC address ; **host\_dmac** , **dmas** destination MAC address; **dmac-mask** mask (reverse mask) of destination MAC address; **protocol** No. of name or IP protocol. It can be a key word: eigrp, gre, icmp, igmp, igrp, ip, ipinip, ospf, tcp, or udp, or an integer from 0-255 of list No. of IP address. Use key word 'ip' to match all Internet protocols (including ICMP, TCP, AND UDP) list; **source-host-ip**, source No. of source network or source host of packet delivery. Numbers of 32-bit binary system with dotted decimal notation expression; **host**: means the address is the IP address of source host, otherwise the IP address of network; **source-wildcard**: reverse of source IP. Numbers of 32-bit binary system expressed by decimal's numbers with four-point separated, reverse mask; **destination-host-ip**, destination No. of destination network or host to which packets are delivered. Numbers of 32-bit binary system with dotted decimal notation expression; **host**:

means the address is that the destination host address, otherwise the network IP address; **destination-wildcard**: mask of destination. 1 Numbers of 32-bit binary system expressed by decimal's numbers with four-point separated, reverse mask; **s-port(optional)**: means the need to match TCP/UDP source port; **port1(optional)**: value of TCP/UDP source interface No., Interface No. is an integer from 0-65535; **<sPortMin>**, the down boundary of source port; **<sPortMax>**, the up boundary of source port; **d-port(optional)**: means need to match TCP/UDP destination interface; **port3(optional)**: value of TCP/UDP destination interface No., Interface No. is an integer from 0-65535; **<dPortMin>**, the down boundary of destination port; **<dPortMax>**, the up boundary of destination port; **[ack] [fin] [psh] [rst] [urg] [syn]**, (optional) only for TCP protocol, multi-choices of tag positions are available, and when TCP data reports the configuration of corresponding position, then initialization of TCP data report is enabled to form a match when in connection; **precedence (optional)** packets can be filtered by priority which is a number from 0-7; **tos (optional)** packets can be filtered by service type which ia number from 0-15; **icmp-type (optional)** ICMP packets can be filtered by packet type which is a number from 0-255; **icmp-code (optional)** ICMP packets can be filtered by packet code which is a number from 0-255; **igmp-type (optional)** ICMP packets can be filtered by IGMP packet name or packet type which is a number from 0-255; **<time-range-name>**, name of time range.

**Command Mode:** Name extended MAC-IP access-list configuration mode

**Default:** No access-list configured.

**Examples:** Deny the passage of UDP packets with any source MAC address and destination MAC address, any source IP address and destination IP address, and source port 100.

```
Switch(config)# mac-ip-access-list extended maclpExt
```

```
Switch(Config-Maclp-Ext-Nacl-maclpExt)# deny any-source-mac any-destination-mac
udp any-source s-port 100 any-destination
```

## 1.26 show access-lists

**Command:** **show access-lists** [**<num>**]**<acl-name>**

**Functions:** Reveal ACL of configuration.

**Parameters:** **<acl-name>**, specific ACL name character string; **<num>**, specific ACL No.

**Default:** None.

**Command Mode:** Admin Mode

**Usage Guide:** When not assigning names of ACL, all ACL will be revealed, used x time (s) indicates the times of ACL to be used.

**Examples:**

```
Switch#show access-lists
```

access-list 10(used 0 time(s))

access-list 10 deny any-source

access-list 100(used 1 time(s))

access-list 100 deny ip any any-destination

access-list 100 deny tcp any any-destination

access-list 1100(used 0 time(s))

access-list 1100 permit any-source-mac any-destination-mac tagged-eth2 14 2 0800

| Displayed information  | Explanation   |
|--|---|
| access-list 10(used 1 time(s))   | Number ACL10, 0 time to be used   |
| access-list 10 deny any-source   | Deny any IP packets to pass   |
| access-list 100(used 1 time(s))  | Nnumber ACL100, 1 time to be used   |
| access-list 100 deny ip any-source any-destination                               | Deny IP packet of any source IP address and destination address to pass   |
| access-list 100 deny tcp any-source any-destination                              | Deny TCP packet of any source IP address and destination address to pass  |
| access-list 1100 permit any-source-mac any-destination-mac tagged-eth2 14 2 0800 | Permit tagged-eth2 with any source MAC addresses and any destination MAC addresses and the packets whose 15 <sup>th</sup> and 16 <sup>th</sup> byte is respectively 0x08 , 0x0 to pass. |

## 1.27 show access-group

**Command:** show access-group in (interface {Ethernet | Ethernet IFNAME})

**Functions:** Display the ACL binding status on the port.

**Parameters:** IFNAME, Port name.

**Default:** None.

**Command Mode:** Admin and Configuration Mode.

**Usage Guide:** When not assigning interface names, all ACL tied to port will be revealed.

**Examples:**

Switch#show access-group

interface name: Ethernet 1/0/1

IP Ingress access-list used is 100, traffic-statistics Disable.

interface name: Ethernet1/0/2

IP Ingress access-list used is 1, packet(s) number is 11110.

| Displayed information              | Explanation  |
|------------------------------------|--|
| interface name: Ethernet 1/0/1     | Tying situation on port Ethernet1/0/1                                |
| IP Ingress access-list used is 100 | No. 100 numeric expansion ACL tied to entrance of port Ethernet1/0/1 |
| packet(s) number is 11110          | Number of packets matching this ACL rule                             |

## 1.28 show firewall

**Command:** show firewall

**Functions:** Reveal configuration information of packet filtering functions.

**Parameters:** None.

**Default:** None.

**Command Mode:** Admin and Configuration Mode.

**Examples:**

Switch#show firewall

Firewall status: Enable.

| Displayed information | Explanation                       |
|-----------------------|-----------------------------------|
| fire wall is enable   | Packet filtering function enabled |

## 1.29 show ipv6 access-lists

**Command:** show ipv6 access-lists [*<num>*/*<acl-name>*]

**Function:** Show the configured IPv6 access control list.

**Parameter:** *<num>* is the number of specific access control list, the valid range is 500~699, amongst 500~599 is digit standard IPv6 ACL number, 600~699 is the digit extended IPv6 ACL number; *<acl-name>* is the nomenclature character string of a specific access control list, lengthening within 1~32.

**Default:** None.

**Command Mode:** Admin and Configuration Mode.

**Usage Guide:** When no access control list is specified, all the access control lists will be displayed; in used x time (s) is shown the times the ACL had been quoted.

**Example:**

```
Switch #show ipv6 access-lists
ipv6 access-list 500(used 1 time(s))
    ipv6 access-list 500 deny any-source

ipv6 access-list 510(used 1 time(s))
    ipv6 access-list 510 deny ip any-source any-destination
    ipv6 access-list 510 deny tcp any-source any-destination

ipv6 access-list 520(used 1 time(s))
    ipv6 access-list 520 permit ip any-source any-destination
```

## 1.30 show time-range

**Command:** `show time-range <word>`

**Functions:** Reveal configuration information of time range functions.

**Parameters:** *word* assign name of time-range needed to be revealed.

**Default:** None.

**Command Mode:** Admin Mode

**Usage Guide:** When not assigning time-range names, all time-range will be revealed.

**Examples:**

```
Switch#show time-range
time-range timer1 (inactive, used 0 times)
    absolute-periodic Saturday 0:0:0 to Sunday 23:59:59
time-range timer2 (inactive, used 0 times)
    absolute-periodic Monday 0:0:0 to Friday 23:59:59
```

## 1.31 time-range

**Command:** `[no] time-range <time_range_name>`

**Functions:** Create the name of time-range as time range name, enter the time-range mode at the same time.

**Parameters:** *time\_range\_name*, time range name must start with letter or number, and the length cannot exceed 32 characters long.

**Command Mode:** Global mode

**Default:** No time-range configuration.

**Usage Guide:** None

**Examples:** Create a time-range named `admin_timer`.

Switch(config)#Time-range admin\_timer

# Chapter 2 Commands for Self-defined ACL

## 2.1 userdefined-access-list standard offset

**Command:** userdefined-access-list standard offset [window1 { I3start | I4start } <offset>] [window2 { I3start | I4start } <offset>] [window3 { I3start | I4start } <offset>] [window4 { I3start | I4start } <offset>] [window5 { I3start | I4start } <offset>] [window6 { I3start | I4start } <offset>] [window7 { I3start | I4start } <offset>] [window8 { I3start | I4start } <offset>] [window9 { I3start | I4start } <offset>] [window10 { I3start | I4start } <offset>] [window11 { I3start | I4start } <offset>] [window12 { I3start | I4start } <offset>]

**no userdefined-access-list standard offset** [window1] [window2] [window3] [window4] [window5] [window6] [window7] [window8] [window9] [window10] [window11] [window12]

**Function:** Create a standard self-defined ACL template. If the template exists, the corresponding window of the template can be modified; the no command deletes the window of the standard self-defined ACL template. If the window is not specified, the standard self-defined ACL template will be deleted.

**Parameter:**

**window1-window12** self-defined window 1 to 12

**I3start** The start offset position is start of layer3 (It can be effective only when the start of layer3 exists)

**I4start** The start offset position is start of layer4 (It can be effective only when the start of layer4 exists)

**offset** The configured offset is from 0 to 178 (unit is 2Bytes)

**Command Mode:** Global Mode

**Default:** No Configuration Template

**Usage Guide:** {I2endoftag | I3start | I4start}: used to configure the start offset position of a window, <offset>: used to the offset of a window, the range is <0-178>, unit is 2Bytes, namely, 0 means 0Bytes offset and 1 means 2Bytes offset. Standard self-defined ACL template can configure the start offset position and offset for 12 window at most. One standard self-defined ACL template can be shared in global mode. The window cannot be modified if the standard self-defined ACL rule is configured with this window. But if the

standard self-defined ACL rule is not configured, the window configuration can be modified with this command.

The no command can delete one or more offset configuration of the window in the template or delete the whole template. The window in the template can be deleted successfully when it is not used by the self-defined ACL rule.

Ipv6 only supports window1-6, the biggest offset of I3start includes the head of L2, the biggest offset of I4start includes the head of L2 and L3.

**Example:** Create a global template with 7 windows (3-9) to configure the start offset position and the offset:

```
Switch(config)#userdefined-access-list standard offset window3 I2 0 window4 I2 2  
window5 I3 0 window6 I3 1 window7 I3 2 window8 I4 1 window9 I4 2
```

## 2.2 userdefined-access-list extended offset

This command is not supported by switch.

## 2.3 userdefined-access-list standard

**Command:** userdefined-access-list standard <1200-1299> {permit|deny}  
{window1|window2|window3|window4|window5|window6|window7|window8|window9|window10|window11|window12}

no userdefined-access-list standard <1200-1299> {permit|deny}  
{window1|window2|window3|window4|window5|window6|window7|window8|window9|window10|window11|window12}

**Function:** Create a numbered standard self-defined ACL. If the standard self-defined ACL exists, then a rule will be added to the ACL. The no command deletes a numbered standard self-defined ACL.

**Parameter:** <num> is the access-list No. from 1200 to 1299 in decimal notation; **deny** if rules are matching, deny access; **permit** if rules are matching, permit access; <value> and <mask> of each window is a 2 bits Hexadecimal number.

**Command Mode:** Global Mode

**Default:** No any access-list configured

**Usage Guide:** When users specify the specified <num> for the first time, create the ACL with this serial number, then add the entry into this ACL.

**Example:** Permit the second bytes of the start of I3 is 0x4501. Permit the packets that the forth byte of the start of I4 is 0xFF.

```
Switch(config)#userdefined-access-list standard offset window1 I3 0 window2 I4 1
Switch(config)#userdefined-access-list standard 1200 permit window1 4501 FFFF
window2 00FF 00FF. Configure a rule in the same list to deny the packets that the fifth and
the sixth bytes of the start of I3 is 0xFFAA.
```

```
Switch(config)#userdefined-access-list standard offset window3 I3 2
Switch(config)#userdefined-access-list standard 1200 deny any-source-mac
any-destination-mac untagged-eth2 window3 FFAA FFFF
```

## 2.4 userdefined-access-list extended

This command is not supported by switch.

## 2.5 userdefined access-group

**Command:** `userdefined access-group <name> {in} [traffic-statistic]`

**no userdefined access-group <name> {in}**

**Function:** Apply userdefined-access-list to one direction of the port. Decide whether the statistical counter should be added to the ACL according to the options. The no command deletes the configuration bound to the port.

**Parameter:** <name> is the access-list name from 1200-1399 in decimal notation.

**Command Mode:** Physical Port Configuration Mode.

**Default:** userdefined-access-list is not bound to the port

**Usage Guide:** A self-defined access-list can be bound to the ingress of a port and can be configured at the ingress of the same port with other access-lists at the same time. The deny rule is precedent when different access-lists are matching, that means if there is a access-lists match the deny rule, the deny rule must be executed, the permit rule will be executed oppositely.

**Example:** The configured self-defined access-list is shown in the following:

```
Switch(config)#userdefined-access-list standard offset window1 I3 0 window2 I4 1
window3 I3 1
```

```
Switch(config)#userdefined-access-list standard 1300 permit window1 4501 FFFF
window2 00FF 00FF
```

```
Switch(config)#userdefined-access-list standard 1300 deny window1 FFAA0000
FFFF0000
```

Bind the self-defined access-list to Ethernet1/1:

```
Switch(config)#interface ethernet1/1
```

```
Switch(config-if-ethernet1/1)#userdefined access-group 1300 in
```

## 2.6 vACL userdefined access-group

**Command:** `vacl userdefined access-group <name> {in} vlan <vlanId>`  
`[traffic-statistic]`

**no vacl userdefined access-group <name> {in} vlan <vlanId>**

**Function:** Apply userdefined-access-list to one direction of the specified VLAN, decide whether the statistical counter should be added to the ACL according to the options or. The `no` command deletes the configuration bound to the specified VLAN.

**Parameter:** `<name>` is the access-list name from 1200 to 1399 in decimal notation; `<vlanId>` the bound VLAN, the range is 1-4095.

**Command Mode:** Global Mode

**Default:** userdefined-access-list is not bound to any VLAN

**Usage Guide:** A self-defined access-list can be bound to the ingress of a VLAN and can be configured at the ingress of the same VLAN with other access-lists at the same time. The deny rule is precedent when different access-lists are matching, that means if there is a access-lists match the deny rule, the deny rule must be executed, the permit rule will be executed oppositely.

**Example:** The configured self-defined access-list is shown in the following:

```
Switch(config)#userdefined-access-list standard offset window1 I3 0 window2 I4 1  
window3 I3 1
```

```
Switch(config)#userdefined-access-list standard 1300 permit window1 4501 FFFF  
window2 00FF 00FF
```

```
Switch(config)#userdefined-access-list standard 1300 deny window1 FFAA0000  
FFFF0000
```

Bind the self-defined access-list to VLAN1:

```
Switch(config)#vacl userdefined access-group 1300 in vlan 1.
```

## Chapter 3 Commands for 802.1x

### 3.1 debug dot1x detail

**Command:** `debug dot1x detail {pkt-send | pkt-receive | internal | all | userbased}`  
`interface [ethernet] <interface-name>`

`no debug dot1x detail { pkt-send | pkt-receive | internal | all | userbased}`  
`interface [ethernet] <interface-name>`

**Function:** Enable the debug information of dot1x details; the no operation of this command will disable that debug information.

**Parameters:** **pkt-send:** Enable the debug information of dot1x about sending packets;

**pkt-receive:** Enable the debug information of dot1x about receiving packets;

**internal:** Enable the debug information of dot1x about internal details;

**all:** Enable the debug information of dot1x about all details mentioned above;

**userbased:** user-based authentication;

**<interface-name>:** the name of the interface.

**Command Mode:** Admin Mode.

**Usage Guide:** By enabling the debug information of dot1x details, users can check the detailed processes of the Radius protocol operation, which might help diagnose the cause of faults if there is any.

**Example:** Enable all debug information of dot1x details on interface1/0/1.

```
Switch#debug dot1x detail all interface ethernet1/0/1
```

### 3.2 debug dot1x error

**Command:** `debug dot1x error`

`no debug dot1x error`

**Function:** Enable the debug information of dot1x about errors; the no operation of this command will disable that debug information.

**Parameters:** None.

**Command Mode:** Admin Mode.

**Usage Guide:** By enabling the debug information of dot1x about errors, users can check the information of errors that occur in the processes of the Radius protocol operation, which might help diagnose the cause of faults if there is any.

**Example:** Enable the debug information of dot1x about errors.

```
Switch#debug dot1x error
```

### 3.3 debug dot1x fsm

**Command:** `debug dot1x fsm {all | aksm | asm | basm | ratsm} interface <interface-name>`

`no debug dot1x fsm {all | aksm | asm | basm | ratsm} interface <interface-name>`

**Function:** Enable the debug information of dot1x state machine; the no operation of this command will disable that debug information.

**Command Mode:** Admin Mode.

**Parameters:** **all:** Enable the debug information of dot1x state machine;

**aksm:** Enable the debug information of Authenticator Key Transmit state machine;

**asm:** Enable the debug information of Authenticator state machine;

**basm:** Enable the debug information of Backend Authentication state machine;

**ratsm:** Enable the debug information of Re-Authentication Timer state machine;

**<interface-name>:** the name of the interface.

**Usage Guide:** By enabling the debug information of dot1x, users can check the negotiation process of dot1x protocol, which might help diagnose the cause of faults if there is any.

**Example:** Enable the debug information of dot1x state machine.

```
Switch#debug dot1x fsm asm interface ethernet1/0/1
```

### 3.4 debug dot1x packet

**Command:** `debug dot1x packet {all | receive | send} interface <interface-name>`

`no debug dot1x packet {all | receive | send} interface <interface-name>`

**Function:** Enable the debug information of dot1x about messages; the no operation of this command will disable that debug information.

**Command Mode:** Admin Mode.

**Parameters:** **send:** Enable the debug information of dot1x about sending packets;

**receive:** Enable the debug information of dot1x about receiving packets;

**all:** Enable the debug information of dot1x about both sending and receiving

packets;

**<interface-name>**: The name of the interface.

**Usage Guide:** By enabling the debug information of dot1x about messages, users can check the negotiation process of dot1x protocol, which might help diagnose the cause of faults if there is any.

**Example:** Enable the debug information of dot1x about messages.

```
Switch#debug dot1x packet all interface ethernet1/0/1
```

### 3.5 dot1x accept-mac

**Command:** dot1x accept-mac <mac-address> [interface <interface-name>]

no dot1x accept-mac <mac-address> [interface <interface-name>]

**Function:** Add a MAC address entry to the dot1x address filter table. If a port is specified, the entry added applies to the specified port only. If no port is specified, the entry added applies to all the ports. The “no dot1x accept-mac <mac-address> [interface <interface-name>]” command deletes the entry from dot1x address filter table.

**Parameters:** <mac-address> stands for MAC address;

<interface-name> for interface name and port number.

**Command mode:** Global Mode.

**Default:** N/A.

**Usage Guide:** The dot1x address filter function is implemented according to the MAC address filter table, dot1x address filter table is manually added or deleted by the user. When a port is specified in adding a dot1x address filter table entry, that entry applies to the port only; when no port is specified, the entry applies to all ports in the switch. When dot1x address filter function is enabled, the switch will filter the authentication user by the MAC address. Only the authentication request initiated by the users in the dot1x address filter table will be accepted, the rest will be rejected.

**Example:** Adding MAC address 00-01-34-34-2e-0a to the filter table of Ethernet 1/0/5.

```
Switch(config)#dot1x accept-mac 00-01-34-34-2e-0a interface ethernet 1/0/5
```

### 3.6 dot1x eapor enable

**Command:** dot1x eapor enable

no dot1x eapor enable

**Function:** Enables the EAP relay authentication function in the switch; the “no dot1x eapor enable” command sets EAP local end authentication.

**Command mode:** Global Mode.

**Default:** EAP relay authentication is used by default.

**Usage Guide:** The switch and RADIUS may be connected via Ethernet or PPP. If an Ethernet connection exists between the switch and RADIUS server, the switch needs to authenticate the user by EAP relay (EAPoR authentication); if the switch connects to the RADIUS server by PPP, the switch will use EAP local end authentication (CHAP authentication). The switch should use different authentication methods according to the connection between the switch and the authentication server.

**Example:** Setting EAP local end authentication for the switch.

```
Switch(config)#no dot1x eapor enable
```

## 3.7 dot1x enable

**Command:** dot1x enable

**no dot1x enable**

**Function:** Enables the 802.1x function in the switch and ports: the "no dot1x enable" command disables the 802.1x function.

**Command mode:** Global Mode and Port Mode.

**Default:** 802.1x function is not enabled in global mode by default; if 802.1x is enabled under Global Mode, 802.1x will not be enabled for the ports by default.

**Usage Guide:** The 802.1x authentication for the switch must be enabled first to enable 802.1x authentication for the respective ports. If Spanning Tree or MAC binding is enabled on the port, or the port is a Trunk port or member of port aggregation group, 802.1x function cannot be enabled for that port unless such conditions are removed.

**Example:** Enabling the 802.1x function of the switch and enable 802.1x for port1/0/12.

```
Switch(config)#dot1x enable
```

```
Switch(config)#interface ethernet 1/0/12
```

```
Switch(Config-If-Ethernet1/0/12)#dot1x enable
```

## 3.8 dot1x ipv6 passthrough

This command is not supported by switch.

## 3.9 dot1x guest-vlan

**Command:** dot1x guest-vlan <vlanid>

**no dot1x guest-vlan**

**Function:** Set the guest-vlan of the specified port; the "no dot1x guest-vlan" command is

used to delete the guest-vlan.

**Parameters:** <vlanid> the specified VLAN id, ranging from 1 to 4094.

**Command Mode:** Port Mode.

**Default Settings:** There is no 802.1x guest-vlan function on the port.

**User Guide:** The access device will add the port into Guest VLAN if there is no supplicant getting authenticated successfully in a certain stretch of time because of lacking exclusive authentication supplicant system or the version of the supplicant system being too low.

In Guest VLAN, users can get 802.1x supplicant system software, update supplicant system or update some other applications (such as anti-virus software, the patches of operating system). When a user of a port within Guest VLAN starts an authentication, the port will remain in Guest VLAN in the case of a failed authentication. If the authentication finishes successfully, there are two possible results:

- ☞ The authentication server assigns an Auto VLAN, causing the port to leave Guest VLAN to join the assigned Auto VLAN. After the user gets offline, the port will be allocated back into the specified Guest VLAN.
- ☞ The authentication server assigns an Auto VLAN, then the port leaves Guest VLAN and joins the specified VLAN. When the user becomes offline, the port will be allocated to the specified Guest VLAN again.

**Attention:**

- ☞ There can be different Guest VLAN set on different ports, while only one Guest VLAN is allowed on one port.
- ☞ Only when the access control mode is portbased, the Guest VLAN can be configured effectively. If the access control mode of the port is macbased or userbased, the Guest VLAN cannot be successfully configured.

**Examples:** Set Guest-VLAN of port Ethernet1/0/3 as VLAN 10.

```
Switch(Config-If-Ethernet1/0/3)#dot1xguest-vlan 10
```

## 3.10 dot1x macfilter enable

**Command:** dot1x macfilter enable

**no dot1x macfilter enable**

**Function:** Enables the dot1x address filter function in the switch; the "no dot1x macfilter enable" command disables the dot1x address filter function.

**Command mode:** Global Mode

**Default:** dot1x address filter is disabled by default.

**Usage Guide:** When dot1x address filter function is enabled, the switch will filter the authentication user by the MAC address. Only the authentication request initialed by the users in the dot1x address filter table will be accepted.

**Example:** Enabling dot1x address filter function for the switch.

```
Switch(config)#dot1x macfilter enable
```

### 3.11 dot1x macbased guest-vlan

**Command:** dot1x macbased guest-vlan <vlanid>  
no dot1x macbased guest-vlan

**Function:** Configure to appoint the port's guest-vlan based on the mac authentication; the no command deletes this guest-vlan.

**Parameters:** <vlanid>: the configured vlan id, the range is from 1 to 4094.

**Command mode:** Port Mode.

**Default:** Do not configure 802.1x macbased guest-vlan.

**Usage Guide:** If there is no dedicated authentication client or the client version was too low, and it makes no clients authenticate successfully on the port in some time, then the access device will make this user join to the guest VLAN. User can get the 802.1x client software in guest VLAN, update the client or do other updating things (such as anti-virus software, system patches and etc.) When the user under the port in Guest VLAN issues the authentication, this port will be stay in guest VLAN if the authentication failed; if it was successful, there are two situations as below:

1. The authentication server issues an auto VLAN, in this time, the user left the guest VLAN and joined to the auto VLAN. After the user was downline, this user will be assigned to the configured guest VLAN again.
2. The authentication server did not issue the VLAN, in this time, the user left the guest VLAN and joined to the configured native VLAN. After the user was downline, this user will be assigned to the configured guest VLAN again.

**Notice:**

1. dot1x macbased guest-vlan can be configured only on the port based on mac authentication and in HYBRID mode.
2. Different macbased guestVLAN can be configured on different ports, but only one macbased guestVLAN can be configured on one port.

**Example:** Configure the guest-vlan of Ethernet1/0/3 as Vlan 10.

```
Switch(Config-If-Ethernet1/0/3)#dot1x macbased guest-vlan 10
```

### 3.12 dot1x macbased port-down-flush

**Command:** dot1x macbased port-down-flush  
no dot1x macbased port-down-flush

**Function:** Enables this command, when the dot1x certification according to mac is down, delete the user who passed the certification of the port; The no command does not make the down operation.

**Command mode:** Global Mode

**Default:** The command is not enabled by default.

**Usage Guide:** When users who passed the certification according to mac changed among different ports, delete the user for the new certification. The command should be enable to delete the user.

**Example:** When the dot1x certification according to mac is down, delete the user who passed the certification of the port.

```
Switch(config)#dot1x macbased port-down-flush
```

### 3.13 dot1x max-req

**Command:** dot1x max-req <count>

no dot1x max-req

**Function:** Sets the number of EAP request/MD5 frame to be sent before the switch re-initials authentication on no supplicant response; the “no dot1x max-req” command restores the default setting.

**Parameters:** <count> is the times to re-transfer EAP request/ MD5 frames, the valid range is 1 to 10.

**Command mode:** Global Mode.

**Default:** The default maximum for retransmission is 2.

**Usage Guide:** The default value is recommended in setting the EAP request/ MD5 retransmission times.

**Example:** Changing the maximum retransmission times for EAP request/ MD5 frames to 5 times.

```
Switch(config)#dot1x max-req 5
```

### 3.14 dot1x user allow-movement

**Command:** dot1x user allow-movement

no dot1x user allow-movement

**Function:** Enable the authentication function after the user moves the port, the no command disables the function.

**Command Mode:** Global mode

**Default:** Disable the authentication function after the user moves the port.

**Usage Guide:** Enable the authentication function after the user moves the port, so the switch allows user to process this authentication. In the condition that the switch connects with hub, when the user will be moved to other port, dot1x user allow-movement command should be enabled.

**Example:** Enable the authentication function after the user moves the port.

```
Switch(config)#dot1x user allow-movement
```

## 3.15 dot1x user free-resource

**Command:** dot1x user free-resource <prefix> <mask>

**no dot1x user free-resource**

**Function:** To configure 802.1x free resource; the no form command closes this function.

**Parameter:** <prefix> is the segment for limited resource, in dotted decimal format;

<mask> is the mask for limited resource, in dotted decimal format.

**Command Mode:** Global Mode.

**Default:** There is no free resource by default.

**Usage Guide:** This command is available only if user based access control is applied. If user based access control has been applied, this command configures the limited resources which can be accessed by the un-authenticated users. For port based and MAC based access control, users could access no network resources before authentication.

If TrustView management system is available, the free resource can be configured in TrustView server, and the TrustView server will distribute the configuration to the switches.

To be noticed, only one free resource can be configured for the overall network.

**Example:** To configure the free resource segment as 1.1.1.0, the mask is 255.255.255.0.

```
Switch(Config)#dot1x user free-resource 1.1.1.0 255.255.255.0
```

## 3.16 dot1x max-user macbased

**Command:** dot1x max-user macbased <number>

**no dot1x max-user macbased**

**Function:** Sets the maximum users allowed connect to the port; the “no dot1x max-user” command restores the default setting.

**Parameters:** <number> is the maximum users allowed, the valid range is 1 to 256.

**Command mode:** Port configuration Mode.

**Default:** The default maximum user allowed is 1.

**Usage Guide:** This command is available for ports using MAC-based access management, if MAC address authenticated exceeds the number of allowed user, additional users will not be able to access the network.

**Example:** Setting port 1/0/3 to allow 5 users.

```
Switch(Config-If-Ethernet1/0/3)#dot1x max-user macbased 5
```

## 3.17 dot1x max-user userbased

**Command:** dot1x max-user userbased <number>

**no dot1x max-user userbased**

**Function:** Set the upper limit of the number of users allowed access the specified port when using user-based access control mode; the no command is used to reset the default value.

**Parameters:** <number> the maximum number of users allowed to access the network, ranging from 1 to 1~256.

**Command Mode:** Port Mode.

**Default Settings:** The maximum number of users allowed to access each port is 10 by default.

**User Guide:** This command can only take effect when the port adopts user-based access control mode. If the number of authenticated users exceeds the upper limit of the number of users allowed access the network, those extra users can not access the network.

**Examples:** Setting port 1/0/3 to allow 5 users.

```
Switch(Config-If-Ethernet1/0/3)#dot1x max-user userbased 5
```

## 3.18 dot1x portbased mode single-mode

**Command:** dot1x portbased mode single-mode

**no dot1x portbased mode single-mode**

**Function:** Set the single-mode based on portbase authentication mode; the no command disables this function.

**Parameters:** None.

**Command mode:** Port Mode

**Default:** Disable the single-mode.

**Usage Guide:** This command takes effect when the access mode of the port is set as portbase only. Before configuring the single-mode, if the port has enabled dot1x port-method portbased command and exist online users, the switch will enforce all users of this port are offline. After that, this port only allows a user to pass the authentication, the user can access the specified network resource, but other authentication users of this port will be denied and can not access the network. After disabling the single-mode, the switch also enforce the authenticated user is offline.

**Example:**

```
Switch(Config-If-Ethernet1/0/1)#dot1x portbased mode single-mode
```

## 3.19 dot1x port-control

This command is not supported by switch.

## 3.20 dot1x port-method

**Command:** dot1x port-method {macbased | portbased | userbased {standard | advanced}}

**no dot1x port-method**

**Function:** To configure the access control method of appointed interface. The no form command restores the default access control method.

**Parameter:** **macbased** means the access control method based on MAC address

**portbased** means the access control method based on port

**userbased** means the access control method based on user, it can be divided into two types, one is standard access control method, and the other is advanced access control method

**Command mode:** Port Configuration Mode.

**Default:** Advanced access control method based on user is used by default.

**Usage Guide:** This command is used to configure the dot1x authentication method for the specified port. When port based authentication is applied, only one host can authenticate itself through one port. And after authentication, the host will be able to access all the resources. When MAC based authentication is applied, multiple host which are connected to one port can access all the network resources after authentication. When either of the above two kinds of access control is applied, un-authenticated host cannot access any resources in the network.

When user based access control is applied, un-authenticated users can only access limited resources of the network. The user based access control falls into two kinds – the standard access control and the advanced access control. The standard user based access control does not limit the access to the limited resources when the host is not authenticated yet. While the user based advanced access control can control the access to the limited resources before authentication is done.

**Notes:** For standard control method based on user, the 802.1x free resource must be configured first, and it needs to be used with dot1x privateclient enable.

**Example:** To configure the access control method based on port for Ethernet1/0/4.

```
Switch(Config-If-Ethernet1/0/4)#dot1x port-method portbased
```

## 3.21 dot1x privateclient enable

**Command:** dot1x privateclient enable

**no dot1x privateclient enable**

**Function:** To configure the switch to force the authentication client to use private 802.1x authentication protocol. The no prefix will disable the command and allow the authentication client to use the standard 802.1x authentication protocol.

**Command Mode:** Global Mode.

**Default:** Private 802.1x authentication packet format is disabled by default.

**Usage Guide:** To implement integrated solution, the switch must be enabled to use private 802.1x protocol, or many applications will not be able to function. For detailed information, please refer to DCBI integrated solution. If the switch forces the authentication client to use private 802.1x protocol, the standard client will not be able to work.

**Example:** To force the authentication client to use private 802.1x authentication protocol.

```
Switch(config)#dot1x privateclient enable
```

## 3.22 dot1x privateclient protect enable

**Command:** dot1x privateclient protect enable

**no dot1x privateclient protect enable**

**Function:** Enable the privateclient protect function of the switch, the no command disables the protect function.

**Parameter:** None.

**Command mode:** Global Mode

**Default:** Disable the privateclient protect function.

**Usage Guide:** Support the partial encryption of the privateclient protocol to advance the security of the privateclient.

**Example:** Enable the privateclient protect function of the switch.

```
Switch(config)#dot1x privateclient protect enable
```

## 3.23 dot1x re-authenticate

**Command:** dot1x re-authenticate [interface <interface-name>]

**Function:** Enables real-time 802.1x re-authentication (no wait timeout requires) for all ports or a specified port.

**Parameters:** <interface-name> stands for port number, omitting the parameter for all

ports.

**Command mode:** Global Mode.

**Usage Guide:** This command is a Global Mode command. It makes the switch to re-authenticate the client at once without waiting for re-authentication timer timeout. This command is no longer valid after authentication.

**Example:** Enabling real-time re-authentication on port1/0/8.

```
Switch(config)#dot1x re-authenticate interface ethernet 1/0/8
```

## 3.24 dot1x re-authentication

**Command:** dot1x re-authentication

**no dot1x re-authentication**

**Function:** Enables periodical supplicant authentication; the “no dot1x re-authentication” command disables this function.

**Command mode:** Global Mode.

**Default:** Periodical re-authentication is disabled by default.

**Usage Guide:** When periodical re-authentication for supplicant is enabled, the switch will re-authenticate the supplicant at regular interval. This function is not recommended for common use.

**Example:** Enabling the periodical re-authentication for authenticated users.

```
Switch(config)#dot1x re-authentication
```

## 3.25 dot1x timeout quiet-period

**Command:** dot1x timeout quiet-period <seconds>

**no dot1x timeout quiet-period**

**Function:** Sets time to keep silent on supplicant authentication failure; the “no dot1x timeout quiet-period” command restores the default value.

**Parameters:** <seconds> is the silent time for the port in seconds, the valid range is 1 to 65535.

**Command mode:** Global Mode.

**Default:** The default value is 10 seconds.

**Usage Guide:** Default value is recommended.

**Example:** Setting the silent time to 120 seconds.

```
Switch(config)#dot1x timeout quiet-period 120
```

## 3.26 dot1x timeout re-authperiod

**Command:** dot1x timeout re-authperiod <seconds>

**no dot1x timeout re-authperiod**

**Function:** Sets the supplicant re-authentication interval; the “no dot1x timeout re-authperiod” command restores the default setting.

**Parameters:** <seconds> is the interval for re-authentication, in seconds, the valid range is 1 to 65535.

**Command mode:** Global Mode.

**Default:** The default value is 3600 seconds.

**Usage Guide:** dot1x re-authentication must be enabled first before supplicant re-authentication interval can be modified. If authentication is not enabled for the switch, the supplicant re-authentication interval set will not take effect.

**Example:** Setting the re-authentication time to 1200 seconds.

```
Switch(config)#dot1x timeout re-authperiod 1200
```

## 3.27 dot1x timeout tx-period

**Command:** dot1x timeout tx-period <seconds>

**no dot1x timeout tx-period**

**Function:** Sets the interval for the supplicant to re-transmit EAP request/identity frame; the “no dot1x timeout tx-period” command restores the default setting.

**Parameters:** <seconds> is the interval for re-transmission of EAP request frames, in seconds; the valid range is 1 to 65535.

**Command mode:** Global Mode.

**Default:** The default value is 30 seconds.

**Usage Guide:** Default value is recommended.

**Example:** Setting the EAP request frame re-transmission interval to 1200 seconds.

```
Switch(config)#dot1x timeout tx-period 1200
```

## 3.28 dot1x unicast enable

**Command:** dot1x unicast enable

**no dot1x unicast enable**

**Function:** Enable the 802.1x unicast passthrough function of switch; the no operation of this command will disable this function.

**Command mode:** Global Configuration Mode.

**Default:** The 802.1x unicast passthrough function is not enabled in global mode.

**Usage Guide:** The 802.1x unicast passthrough authentication for the switch must be enabled first to enable the 802.1x unicast passthrough function, then the 802.1x function is configured.

**Example:** Enabling the 802.1x unicast passthrough function of the switch and enable the 802.1x for port 1/0/1.

```
Switch(config)#dot1x enable
```

```
Switch(config)# dot1x unicast enable
```

```
Switch(config)#interface ethernet1/0/1
```

```
Switch(Config-If-Ethernet1/0/1)#dot1x enable
```

### 3.29 dot1x web authentication enable

This command is not supported by switch.

### 3.30 dot1x web authentication ipv6 passthrough

This command is not supported by switch.

### 3.31 dot1x web redirect

This command is not supported by switch.

### 3.32 dot1x web redirect enable

This command is not supported by switch.

### 3.33 show dot1x

**Command:** `show dot1x [interface <interface-list>]`

**Function:** Displays dot1x parameter related information, if parameter information is added, corresponding dot1x status for corresponding port is displayed.

**Parameters:** `<interface-list>` is the port list. If no parameter is specified, information for all ports is displayed.

**Command mode:** Admin and Configuration Mode.

**Usage Guide:** The dot1x related parameter and dot1x information can be displayed with “show dot1x” command.

**Example:**

1. Display information about dot1x global parameter for the switch.

```
Switch#show dot1x
```

```
Global 802.1x Parameters
```

```
reauth-enabled      no
reauth-period       3600
quiet-period        10
tx-period           30
max-req             2
authenticator mode  passive
```

```
Mac Filter Disable
```

```
MacAccessList :
```

```
dot1x-EAPoR Enable
```

```
dot1x-privateclient Disable
```

```
dot1x-unicast Disable
```

```
802.1x is enabled on ethernet Ethernet1/0/1
```

```
Authentication Method:Port based
```

```
Max User Number:1
```

```
Status              Authorized
Port-control        Auto
Supplicant          00-03-0F-FE-2E-D3
```

```
Authenticator State Machine
```

```
State              Authenticated
```

```
Backend State Machine
```

```
State              Idle
```

```
Reauthentication State Machine
```

```
State              Stop
```

| Displayed information    | Explanation                                 |
|--------------------------|---|
| Global 802.1x Parameters | Global 802.1x parameter information         |
| reauth-enabled           | Whether re-authentication is enabled or not |

|   |   |
|---|---|
| reauth-period                               | Re-authentication interval  |
| quiet-period                                | Silent interval   |
| tx-period                                   | EAP retransmission interval   |
| max-req                                     | EAP packet retransmission interval                                  |
| authenticator mode                          | Switch authentication mode  |
| Mac Filter                                  | Enables dot1x address filter or not                                 |
| MacAccessList                               | Dot1x address filter table  |
| dot1x-EAPoR                                 | Authentication method used by the switch (EAP relay, EAP local end) |
| dot1x-privateclient                         | Whether the switch supports the privateclient                       |
| 802.1x is enabled on ethernet Ethernet1/0/1 | Indicates whether dot1x is enabled for the port                     |
| Authentication Method:                      | Port authentication method (MAC-based, port-based, user-based)      |
| Status                                      | Port authentication status  |
| Port-control                                | Port authorization status   |
| Supplicant                                  | Authenticator MAC address   |

| Reauthentication State Machine              | Re-authentication state machine status                              |

### 3.34 user-control limit

This command is not supported by switch.

### 3.35 user-control limit ipv6

This command is not supported by switch.

# Chapter 4 Commands for the Number Limitation Function of MAC and IP in Port, VLAN

## 4.1 debug ip arp count

**Command:** debug ip arp count

**no debug ip arp count**

**Function:** When the number limitation function debug of ARP in the VLAN, if the number of dynamic ARP and the number of ARP in the VLAN is larger than the max number allowed, users will see debug information. "no debug ip arp count" command is used to disable the number limitation function debug of ARP in the VLAN.

**Parameters:** None.

**Command Mode:** Admin Mode.

**Default Settings:** None.

**Usage Guide:** Display the debug information of the number of dynamic ARP in the VLAN.

**Examples:**

```
Switch#debug vlan mac count
```

```
%Jun 14 16:04:40 2007 Current arp count 21 is more than or equal to the maximum limit  
in vlan 1!!
```

```
%Jun 14 16:04:40 2007Arp learning will be stopped and some arp will be delete !!
```

## 4.2 debug ipv6 nd count

**Command:** debug ipv6 nd count

**no debug ipv6 nd count**

**Function:** When the number limitation function debug of neighbor in the VLAN, if the number of dynamic neighbor and the number of neighbor in the VLAN is larger than the max number allowed, users will see debug information. "no debug ip neighbor count" command is used to disable the number limitation function debug of neighbor in the VLAN.

**Parameters:** None.

**Command Mode:** Admin Mode.

**Default Settings:** None.

**Usage Guide:** Display the debug information of the number of dynamic neighbor in the VLAN.

**Examples:**

```
Switch#debug vlan mac count
```

```
%Jun 14 16:04:40 2007 Current neighbor count 21 is more than or equal to the maximum  
limit in vlan 1!!
```

## 4.3 debug switchport arp count

**Command:** debug switchport arp count

**no debug switchport arp count**

**Function:** When the number limitation function debug of ARP on the port, if the number of dynamic ARP and the number of ARP on the port is larger than the max number allowed, users will see debug information." **no debug switchport arp count**" command is used to disable the number limitation function debug of ARP on the port.

**Parameters:** None

**Command Mode:** Admin Mode

**Default Settings:** None

**Usage Guide:** Display the debug information of the number of dynamic ARP on the port.

**Examples:**

```
Switch#debug switchport arp count
```

```
%Jun 14 16:04:40 2007 Current arp count 21 is more than or equal to the maximum limit  
in port Ethernet3/1
```

```
!!%Jun 14 16:04:40 2007 Arp learning will be stopped and some mac will be delete !!
```

## 4.4 debug switchport mac count

**Command:** debug switchport mac count

**no debug switchport mac count**

**Function:** When the number limitation function debug of MAC on the port, if the number of dynamic MAC and the number of MAC on the port is larger than the max number allowed, users will see debug information. "**no debug switchport mac count**" command is used to disable the number limitation function debug of MAC on the port.

**Parameters:** None

**Command Mode:** Admin Mode

**Default Settings:** None

**Usage Guide:** Display the debug information of the number of dynamic MAC on the port.

**Examples:**

```
Switch#debug switchport mac count
```

```
%Jun 14 16:04:40 2007 Current mac count 21 is more than or equal to the maximum limit  
in port Ethernet3/1
```

```
!!%Jun 14 16:04:40 2007 Mac learning will be stopped and some mac will be delete !!
```

## 4.5 debug switchport nd count

**Command:** debug switchport nd count

**no debug switchport nd count**

**Function:** When the number limitation function debug of ND on the port, if the number of dynamic ND and the number of ND on the port is larger than the max number allowed, users will see debug information. "no debug switchport nd count" command is used to disable the number limitation function debug of ND on the port.

**Parameters:** None

**Command Mode:** Admin Mode

**Default Settings:** None

**Usage Guide:** Display the debug information of the number of dynamic ND on the port

**Examples:**

```
Switch#debug switchport arp count
```

```
%Jun 14 16:04:40 2007 Current neighbor count 21 is more than or equal to the maximum  
limit in port Ethernet3/1
```

```
!!%Jun 14 16:04:40 2007 Neighbor learning will be stopped and some mac will be delete !!
```

## 4.6 ip arp dynamic maximum

**Command:** ip arp dynamic maximum <value>

**no ip arp dynamic maximum**

**Function:** Set the max number of dynamic ARP allowed in the VLAN, and, at the same time, enable the number limitation function of dynamic ARP in the VLAN; "no ip arp dynamic maximum" command is used to disable the number limitation function of dynamic ARP in the VLAN.

**Parameters:** <value> upper limit of the number of dynamic ARP in the VLAN, ranging from 1 to 4096.

**Default Settings:** The number limitation function of dynamic ARP in the VLAN is disabled.

**Command Mode:** Interface Configuration Mode.

**Usage Guide:** When configuring the max number of dynamic ARP allowed in the VLAN, if the number of dynamically learnt ARP in the VLAN is already larger than the max number to be set, the extra dynamic ARP will be deleted.

**Examples:**

Enable the number limitation function of dynamic ARP in VLAN 1, the max number to be set is 50.

```
Switch(config)#interface ethernet
```

```
Switch(Config-if-Vlan1)# ip arp dynamic maximum 50
```

Disable the number limitation function of dynamic ARP in VLAN 1.

```
Switch(Config-if-Vlan1)#no ip arp dynamic maximum
```

## 4.7 ipv6 nd dynamic maximum

**Command:** `ipv6 nd dynamic maximum <value>`  
`no ipv6 nd dynamic maximum`

**Function:** Set the max number of dynamic NEIGHBOR allowed in the VLAN, and, at the same time, enable the number limitation function of dynamic NEIGHBOR in the VLAN; “no ipv6 nd dynamic maximum” command is used to disable the number limitation function of dynamic NEIGHBOR in the VLAN.

**Parameters:** `<value>` upper limit of the number of dynamic NEIGHBOR in the VLAN, ranging from 1 to 4096.

**Default Settings:** The number limitation function of dynamic NEIGHBOR in the VLAN is disabled.

**Command Mode:** Interface Configuration Mode.

**Usage Guide:** When configuring the max number of dynamic NEIGHBOR allowed in the VLAN, if the number of dynamically learnt NEIGHBOR in the VLAN is already larger than the max number to be set, the extra dynamic NEIGHBOR will be deleted.

**Examples:**

Enable the number limitation function of dynamic NEIGHBOR in VLAN 1, the max number to be set is 50.

```
Switch(config)#interface ethernet
```

```
Switch(Config-if-Vlan1)# ipv6 nd dynamic maximum 50
```

Disable the number limitation function of dynamic NEIGHBOR in VLAN 1.

```
Switch(Config-if-Vlan1)#no ipv6 nd dynamic maximum
```

## 4.8 show arp-dynamic count

**Command:** show arp-dynamic count {(vlan <1-4096>)| interface ethernet <portName>}

**Function:** Display the number of dynamic ARP of corresponding port and VLAN.

**Parameters:** <vlan-id> is the specified vlan ID.

<portName> is the name of layer-2 port.

**Command Mode:** Admin and Configuration Mode.

**Usage Guide:** Use this command to display the number of dynamic ARP of corresponding port and VLAN.

**Examples:** Display the number of dynamic ARP of the port and VLAN which are configured with number limitation function of ARP.

Switch(config)# show arp-dynamic count interface ethernet 1/0/3

| Port          | MaxCount | CurrentCount |
|---------------|----------|--------------|
| Ethernet1/0/3 | 5        | 1            |

Switch(config)# show arp-dynamic count vlan 1

| Vlan | MaxCount | CurrentCount |
|------|----------|--------------|
| 1    | 55       | 15           |

## 4.9 show mac-address dynamic count

**Command:** show mac-address dynamic count { (vlan <1-4096>)| interface ethernet <portName>}

**Function:** Display the number of dynamic MAC of corresponding port and VLAN.

**Parameters:** <vlan-id> display the specified VLAN ID.

<portName> is the name of layer-2 port.

**Command Mode:** Any mode

**Usage Guide:** Use this command to display the number of dynamic MAC of corresponding port and VLAN.

**Examples:** Display the number of dynamic MAC of the port and VLAN which are configured with number limitation function of MAC.

Switch(config)# show mac-address dynamic count interface ethernet 1/0/3

| Port          | MaxCount | CurrentCount |
|---------------|----------|--------------|
| Ethernet1/0/3 | 55       | 15           |

```
-----
Ethernet1/0/3          5          1
-----
```

```
Switch(config)# show mac-address dynamic count vlan 1
```

```
Vlan          MaxCount          CurrentCount
-----
```

```
1             55             15
-----
```

## 4.10 show nd-dynamic count

**Command:** `show nd-dynamic count {(vlan <1-4096>)| interface ethernet <portName>}`

**Function:** Display the number of dynamic ND of corresponding port and VLAN.

**Parameters:** `<vlan-id>` is play the specified vlan ID. `<portName>` is the name of layer-2 port.

**Command Mode:** Admin and Configuration Mode.

**Usage Guide:** Use this command to display the number of dynamic ND of corresponding port and VLAN.

**Examples:** Display the number of dynamic ND of the port and VLAN which are configured with number limitation function of ND.

```
Switch(config)# show nd-dynamic count interface ethernet 1/0/3
```

```
Port          MaxCount          CurrentCount
-----
```

```
Ethernet1/0/3      5          1
-----
```

```
Switch(config)# show nd-dynamic count vlan 1
```

```
Vlan          MaxCount          CurrentCount
-----
```

```
1             55             15
-----
```

## 4.11 switchport arp dynamic maximum

**Command:** `switchport arp dynamic maximum <value>`

`no switchport arp dynamic maximum`

**Function:** Set the max number of dynamic ARP allowed by the port, and, at the same time, enable the number limitation function of dynamic ARP on the port; “**no switchport arp dynamic maximum**” command is used to disable the number limitation function of dynamic ARP on the port.

**Parameters:** *<value>* upper limit of the number of dynamic ARP of the port, ranging from 1 to 4096.

**Default Settings:** The number limitation function of dynamic ARP on the port is disabled.

**Command Mode:** Port mode.

**Usage Guide:** When configuring the max number of dynamic ARP allowed by the port, if the number of dynamically learnt ARP on the port is already larger than the max number to be set, the extra dynamic ARP will be deleted. TRUNK ports do not supports this function.

**Examples:**

Enable the number limitation function of dynamic ARP in port 1/0/2 mode, the max number to be set is 20

```
Switch(config)#interface ethernet 1/0/2
```

```
Switch(Config-If-Ethernet1/0/2)# switchport arp dynamic maximum 20
```

Disable the number limitation function of dynamic ARP in port 1/0/2 mode

```
Switch(Config-If-Ethernet1/0/2)#no switchport arp dynamic maximum
```

## 4.12 switchport mac-address dynamic maximum

**Command:** **switchport mac-address dynamic maximum *<value>***

**no switchport mac-address dynamic maximum**

**Function:** Set the max number of dynamic MAC address allowed by the port, and, at the same time, enable the number limitation function of dynamic MAC address on the port; “**no switchport mac-address dynamic maximum**” command is used to disable the number limitation function of dynamic MAC address on the port.

**Parameters:** *<value>* upper limit of the number of dynamic MAC address of the port, ranging from 1 to 4096.

**Default Settings:** The number limitation function of dynamic MAC address on the port is disabled.

**Command Mode:** Port mode.

**Usage Guide:** When configuring the max number of dynamic MAC address allowed by the port, if the number of dynamically learnt MAC address on the port is already larger than the max number of dynamic MAC address to be set, the extra dynamic MAC addresses will be deleted. This function is mutually exclusive to functions such as dot1x,

MAC binding, if the functions of dot1x, MAC binding or TRUNK are enabled on the port, this function will not be allowed.

**Examples:**

Enable the number limitation function of dynamic MAC address in port 1/0/2 mode, the max number to be set is 20

```
Switch(config)#interface ethernet 1/0/2
```

```
Switch(Config-If-Ethernet1/0/2)# switchport mac-address dynamic maximum 20
```

Disable the number limitation function of dynamic MAC address in port 1/0/2 mode

```
Switch(Config-If-Ethernet1/0/2)#no switchport mac-address dynamic maximum
```

## 4.13 switchport mac-address violation

**Command:** `switchport mac-address violation {protect | shutdown} [recovery <5-3600>]`

`no switchport mac-address violation`

**Function:** Set the violation mode of the port, the no command restores the violation mode to **protect**.

**Parameters:** **protect:** protect mode

**shutdown:** shutdown mode

**recovery:** Configure the border port to automatically restore after execute **shutdown** violation mode

**<5-3600>:** Recovery time, do not restore by default

**Command Mode:** Port mode

**Default:** **protect** mode

**Usage Guide:** The port sets the violation mode after enable the number limit function of MAC only. If the violation mode is **protect**, the port only disable the dynamic MAC address learning function when the MAC address number of the port exceeds the upper limit of secure MAC. If the violation mode is **shutdown**, the port will be disabled when the MAC address number exceeds the upper limit of secure MAC, and the user can enable the port by configuring **no shutdown** command manually or the automatic recovery timeout.

**Example:** Set the violation mode as shutdown, the recovery time as 60s for port1.

```
Switch(config)#interface Ethernet 1/0/1
```

```
Switch(Config-If-Ethernet1/0/1)#switchport mac-address violation shutdown recovery 60
```

## 4.14 switchport nd dynamic maximum

**Command:** `switchport nd dynamic maximum <value>`

**no switchport nd dynamic maximum**

**Function:** Set the max number of dynamic NEIGHBOR allowed by the port, and, at the same time, enable the number limitation function of dynamic NEIGHBOR on the port; “**no switchport nd dynamic maximum**” command is used to disable the number limitation function of dynamic NEIGHBOR on the port.

**Parameters:** *<value>* upper limit of the number of dynamic NEIGHBOR of the port, ranging from 1 to 4096.

**Default Settings:** The number limitation function of dynamic ARP on the port is disabled.

**Command Mode:** Port mode.

**Usage Guide:** When configuring the max number of dynamic NEIGHBOR allowed by the port, if the number of dynamically learnt NEIGHBOR on the port is already larger than the max number to be set, the extra dynamic NEIGHBOR will be deleted. TRUNK ports do not supports this function.

**Examples:**

Enable the number limitation function of dynamic NEIGHBOR in port 1/0/2 mode, the max number to be 20.

```
Switch(config)#interface ethernet 1/0/2
```

```
Switch(Config-If-Ethernet1/0/2)# switchport nd dynamic maximum 20
```

Disable the number limitation function of dynamic NEIGHBOR in port 1/0/2 mode

```
Switch(Config-If-Ethernet1/0/2)#no switchport nd dynamic maximum
```

## 4.15 vlan mac-address dynamic maximum

**Command:** **vlan mac-address dynamic maximum *<value>***

**no vlan mac-address dynamic maximum**

**Function:** Set the max number of dynamic MAC address allowed in the VLAN, and, at the same time, enable the number limitation function of dynamic MAC address in the VLAN; “**no ip mac-address dynamic maximum**” command is used to disable the number limitation function of dynamic MAC address in the VLAN.

**Parameters:** *<value>* upper limit of the number of MAC address in the VLAN, ranging from 1 to 4096.

**Default Settings:** The number limitation function of dynamic MAC address in the VLAN is disabled.

**Command Mode:** VLAN Configuration Mode.

**Usage Guide:** When configuring the max number of dynamic MAC allowed in the VLAN, if the number of dynamically learnt MAC address in the VLAN is already larger than the max number to be set, the extra dynamic MAC addresses will be deleted. After enabling number limitation function of dynamic MAC in the VLAN, the number limitation of MAC is

only applied to general access port, the number of MAC on TURNK ports and special ports which has enabled dot1x, MAC binding function will not be limited or counted.

**Examples:** Enable the number limitation function of dynamic MAC address in VLAN 1, the max number to be set is 50.

```
Switch(config)#vlan1
```

```
Switch(Config-if-Vlan1)#vlan mac-address dynamic maximum 50
```

Enable the number limitation function of dynamic MAC address in VLAN 1.

```
Switch(Config-if-Vlan1)#no vlan mac-address dynamic maximum
```

# Chapter 5 Commands for AM Configuration

## 5.1 am enable

**Command:** am enable

**no am enable**

**Function:** Globally enable/disable AM function.

**Parameters:** None.

**Default:** AM function is disabled by default.

**Command Mode:** Global Mode.

**Usage Guide:** None.

**Example:** Enable AM function on the switch.

Switch(config)#am enable

Disable AM function on the switch.

Switch(config)#no am enable

## 5.2 am port

**Command:** am ipport

**no am port**

**Function:** Enable/disable AM function on port.

**Parameters:** None.

**Default:** AM function is disabled on all port.

**Command Mode:** Port Mode.

**Example:** Enable AM function on interface 1/0/3 of the switch.

Switch(Config-If-Ethernet 1/0/3)#am port

Disable AM function on interface 1/0/3 of the switch.

Switch(Config-If-Ethernet 1/0/3)#no am port

## 5.3 am ip-pool

**Command:** am ip-pool <ip-address> <num>

**no am ip-pool <ip-address> <num>**

**Function:** Set the AM IP segment of the interface, allow/deny the IP messages or APR

messages from a source IP within that segment to be forwarded via the interface.

**Parameters:** *<ip-address>* the starting address of an address segment in the IP address pool; *<num>* is the number of consecutive addresses following ip-address, less than or equal with 32.

**Default:** IP address pool is empty.

**Command Mode:** Port Mode.

**Usage Guide:** None.

**Example:** Configure that interface 1/0/3 of the switch will forward data packets from an IP address which is one of 10 consecutive IP addresses starting from 10.10.10.1.

```
Switch(Config-If-Ethernet 1/0/3)#am ip-pool 10.10.10.1 10
```

## 5.4 am mac-ip-pool

**Command:** am mac-ip-pool *<mac-address>* *<ip-address>*

**no am mac-ip-pool** *<mac-address>* *<ip-address>*

**Function:** Set the AM MAC-IP address of the interface, allow/deny the IP messages or APR messages from a source IP within that segment to be forwarded via the interface.

**Parameter:** *<mac-address>* is the source MAC address; *<ip-address>* is the source IP address of the packets, which is a 32 bit binary number represented in four decimal numbers.

**Default:** MAC-IP address pool is empty.

**Command Mode:** Port Mode.

**Usage Guide:** None.

**Example:** Configure that the interface 1/0/3 of the switch will allow data packets with a source MAC address of 11-22-22-11-11-11 and a source IP address of 10.10.10.1 to be forwarded.

```
Switch(Config-If-Ethernet1/0/3)#am mac-ip-pool 11-22-22-11-11-11 10.10.10.1
```

## 5.5 no am all

**Command:** no am all [ip-pool | mac-ip-pool]

**Function:** Delete MAC-IP address pool or IP address pool or both pools configured by all users.

**Parameters:** ip-pool is the IP address pool; mac-ip-pool is the MAC-IP address pool; no parameter means both address pools.

**Default:** Both address pools are empty at the beginning.

**Command Mode:** Global Mode

**Usage Guide:** None.

**Example:** Delete all configured IP address pools.

```
Switch(config)#no am all ip-pool
```

## 5.6 show am

**Command:** show am [interface <interface-name>]

**Function:** Display the configured AM entries.

**Parameters:** <interface-name> is the name of the interface of which the configuration information will be displayed. No parameter means to display the AM configuration information of all interfaces.

**Command Mode:** Admin and Configuration Mode.

**Example:** Display all configured AM entries.

```
Switch#show am
```

```
AM is enabled
```

```
Interface Ethernet1/0/3
```

```
    am interface
```

```
    am ip-pool 30.10.10.1  20
```

```
Interface Ethernet1/0/5
```

```
    am port
```

```
    am ip-pool 50.10.10.1  30
```

```
    am mac-ip-pool  00-02-04-06-08-09 20.10.10.5
```

```
    am ip-pool 50.20.10.1  20
```

```
Interface Ethernet1/0/6
```

```
    am port
```

```
Interface Ethernet1/0/1
```

```
    am interface
```

```
    am ip-pool 10.10.10.1  20
```

```
    am ip-pool 10.20.10.1  20
```

Display the AM configuration entries of ethernet1/0/5 of the switch.

```
Switch#show am interface ethernet 1/0/5
```

```
AM is enabled
```

```
Interface Etherne1/0/5
```

```
    am interface
```

```
    am ip-pool 50.10.10.1  30
```

```
am mac-ip-pool 00-02-04-06-08-09 20.10.10.5  
am ip-pool 50.20.10.1 20
```

# Chapter 6 Commands for Security Feature

## 6.1 dosattack-check srcip-equal-dstip enable

**Command:** [no] dosattack-check srcip-equal-dstip enable

**Function:** Enable the function by which the switch checks if the source IP address is equal to the destination IP address; the “no” form of this command disables this function.

**Parameter:** None

**Default:** Disable the function by which the switch checks if the source IP address is equal to the destination IP address.

**Command Mode:** Global Mode

**Usage Guide:** By enabling this function, data packet whose source IP address is equal to its destination address will be dropped.

**Example:** Drop the data packet whose source IP address is equal to its destination address.

```
Switch(config)# dosattack-check srcip-equal-dstip enable
```

## 6.2 dosattack-check ipv4-first-fragment enable

This command is not supported by switch.

## 6.3 dosattack-check tcp-flags enable

**Command:** [no] dosattack-check tcp-flags enable

**Function:** Enable the function by which the switch will check the unauthorized TCP label function; the “no” form of this command will disable this function.

**Parameter:** None

**Default:** This function disable on the switch by default

**Command Mode:** Global Mode

**Usage Guide:** With this function enabled, the switch will be able to drop follow four data packets containing unauthorized TCP label: SYN=1 while source port is smaller than 1024;TCP label positions are all 0 while its serial No. =0;FIN=1,URG=1,PSH=1 and the TCP serial No.=0;SYN=1 and FIN=1. This function can be used associating the “dosattack-check ipv4-first-fragment enable” command.

**Example:** Drop one or more types of above four packet types.

```
Switch(config)#dosattack-check tcp-flags enable
```

## 6.4 dosattack-check srcport-equal-dstport enable

**Command:** dosattack-check srcport-equal-dstport enable

**no dosattack-check srcport-equal-dstport enable**

**Function:** Enable the function by which the switch will check if the source port is equal to the destination port; the no command disables this function.

**Parameter:** None

**Default:** Disable the function by which the switch will check if the source port is equal to the destination port.

**Command Mode:** Global Mode

**Usage Guide:** With this function enabled, the switch will be able to drop TCP and UDP data packet whose destination port is equal to the source port. This function can be used associating the “dosattack-check ipv4-first-fragment enable” function so to block the IPv4 fragment TCP and UDP data packet whose destination port is equal to the source port.

**Example:** Drop the non-fragment TCP and UDP data packet whose destination port is equal to the source port.

```
Switch(config)#dosattack-check srcport-equal-dstport enable
```

## 6.5 dosattack-check tcp-fragment enable

This command is not supported by switch.

## 6.6 dosattack-check tcp-segment

This command is not supported by switch.

## 6.7 dosattack-check icmp-attacking enable

**Command:** [no] dosattack-check icmp-attacking enable

**Function:** Enable the ICMP fragment attack checking function on the switch; the “no” form of this command disables this function.

**Parameter:** None

**Default:** Disable the ICMP fragment attack checking function on the switch

**Command Mode:** Global Mode

**Usage Guide:** With this function enabled the switch will be protected from the ICMP fragment attacks, dropping the fragment ICMPv4/v6 data packets whose net length is smaller than the specified value.

**Example:** Enable the ICMP fragment attack checking function.

```
Switch(config)#dosattack-check icmp-attacking enable
```

## 6.8 dosattack-check icmpV4-size

**Command:** dosattack-check icmpV4-size <64-1023>

**Function:** Configure the max net length of the ICMPv4 data packet permitted by the switch.

**Parameter:** <64-1023> is the max net length of the ICMPv4 data packet permitted by the switch.

**Default:** The value is 0x200 by default

**Command Mode:** Global Mode

**Usage Guide:** To use this function you have to enable “dosattack-check icmp-attacking enable” first.

**Example:** Set the max net length of the ICMPv4 data packet permitted by the switch to 100.

```
Switch(config)#dosattack-check icmp-attacking enable
```

```
Switch(config)#dosattack-check icmpV4-size 100
```

## 6.9 dosattack-check icmpv6-size

This command is not supported by switch.

# Chapter 7 Commands for TACACS+

## 7.1 tacacs-server authentication host

**Command:** tacacs-server authentication host <ip-address> [port <port-number>]  
[timeout <seconds>] [key {0 | 7} <string>] [primary]

**no tacacs-server authentication host <ip-address>**

**Function:** Configure the IP address, listening port number, the value of timeout timer and the key string of the TACACS+ server; the no form of this command deletes TACACS+ authentication server.

**Parameter:** <ip-address> is the IP address of the server; <port-number> is the listening port number of the server, the valid range is 0~65535, amongst 0 indicates it will not be an authentication server; <seconds> is the value of TACACS+ authentication timeout timer, shown in seconds and the valid range is 1~60; <string> is the key string, If key option is set as 0, the key is not encrypted and its range should not exceed 64 characters, if key option is set as 7, the key is encrypted and its range should not exceed 64 characters; **primary** indicates it's a primary server.

**Command Mode:** Global Mode

**Default:** No TACACS+ authentication configured on the system by default.

**Usage Guide:** This command is for specifying the IP address, port number, timeout timer value and the key string of the TACACS+ server used on authenticating with the switch. The parameter port is for define an authentication port number which must be in accordance with the authentication port number of specified TACACS+ server which is 49 by default. The parameters key and timeout is used to configure the self-key and self-timeout, if the switch is not configure the timeout<seconds> and key<string>, it will use the global value and key by command tacacs-server timeout<seconds> and tacacs-server key <string>. This command can configure several TACACS+ servers communicate with the switch. The configuration sequence will be used as authentication server sequence. And in case **primary** is configured on one TACACS+ server, the server will be the primary server.

**Example:** Configure the TACACS+ authentication server address to 192.168.1.2, and use the global configured key.

```
Switch(config)#tacacs-server authentication host 192.168.1.2
```

## 7.2 tacacs-server key

**Command:** `tacacs-server key {0 | 7} <string>`

`no tacacs-server key`

**Function:** Configure the key of TACACS+ authentication server; the “`no tacacs-server key`” command deletes the TACACS+ server key.

**Parameter:** `<string>` is the key string of the TACACS+ server. If key option is set as 0, the key is not encrypted and its range should not exceed 64 characters, if key option is set as 7, the key is encrypted and its range should not exceed 64 characters.

**Command Mode:** Global Mode

**Usage Guide:** The key is used on encrypted packet communication between the switch and the TACACS+ server. The configured key must be in accordance with the one on the TACACS+ server or else no correct TACACS+ authentication will be performed. It is recommended to configure the authentication server key to ensure the data security.

**Example:** Configure test as the TACACS+ server authentication key.

```
Switch(config)#tacacs-server key 0 test
```

## 7.3 tacacs-server nas-ipv4

**Command:** `tacacs-server nas-ipv4 <ip-address>`

`no tacacs-server nas-ipv4`

**Function:** Configure the source IP address of TACACS+ packet sent by the switch; the “`no tacacs-server nas-ipv4`” command deletes the configuration.

**Parameter:** `<ip-address>` is the source IP address of TACACS+ packet, in dotted decimal notation, it must be a valid unicast IP address.

**Default:** No specific source IP address for TACACS+ packet is configured, the IP address of the interface from which the TACACS+ packets are sent is used as source IP address of TACACS+ packet.

**Command Mode:** Global Mode

**Usage Guide:** The source IP address must belongs to one of the IP interface of the switch, otherwise an failure message of binding IP address will be returned when the switch send TACACS+ packet. We suggest using the IP address of loopback interface as source IP address, it avoids that the packets from TACACS+ server are dropped when the interface link-down.

**Example:** Configure the source ip address of TACACS+ packet as 192.168.2.254.

```
Switch#tacacs-server nas-ipv4 192.168.2.254
```

## 7.4 tacacs-server timeout

**Command:** tacacs-server timeout <seconds>

**no tacacs-server timeout**

**Function:** Configure a TACACS+ server authentication timeout timer; the “no tacacs-server timeout” command restores the default configuration.

**Parameter:** <seconds> is the value of TACACS+ authentication timeout timer, shown in seconds and the valid range is 1~60.

**Command Mode:** Global Mode

**Default:** 3 seconds by default.

**Usage Guide:** The command specifies the period the switch wait for the authentication through TACACS+ server. When connected to the TACACS+, and after sent the authentication query data packet to the TACACS+ server, the switch waits for the response. If no replay is received during specified period, the authentication is considered failed.

**Example:** Configure the timeout timer of the tacacs+ server to 30 seconds.

```
Switch(config)#tacacs-server timeout 30
```

## 7.5 debug tacacs-server

**Command:** debug tacacs-server

**no debug tacacs-server**

**Function:** Open the debug message of the TACACS+; the “no debug tacacs-server” command closes the TACACS+ debugging messages.

**Command Mode:** Admin Mode

**Parameter:** None.

**Usage Guide:** Enable the TACACS+ debugging messages to check the negotiation process of the TACACS+ protocol which can help detecting the failure.

**Example:** Enable the debugging messages of the TACACS+ protocol.

```
Switch#debug tacacs-server
```

# Chapter 8 Commands for RADIUS

## 8.1 aaa enable

**Command:** `aaa enable`

`no aaa enable`

**Function:** Enables the AAA authentication function in the switch; the "no AAA enable" command disables the AAA authentication function.

**Command mode:** Global Mode.

**Parameters:** No.

**Default:** AAA authentication is not enabled by default.

**Usage Guide:** The AAA authentication for the switch must be enabled first to enable IEEE 802.1x authentication for the switch.

**Example:** Enabling AAA function for the switch.

```
Switch(config)#aaa enable
```

## 8.2 aaa-accounting enable

**Command:** `aaa-accounting enable`

`no aaa-accounting enable`

**Function:** Enables the AAA accounting function in the switch: the "no aaa-accounting enable" command disables the AAA accounting function.

**Command mode:** Global Mode

**Default:** AAA accounting is not enabled by default.

**Usage Guide:** When accounting is enabled in the switch, accounting will be performed according to the traffic or online time for port the authenticated user is using. The switch will send an "accounting started" message to the RADIUS accounting server on starting the accounting, and an accounting packet for the online user to the RADIUS accounting server every five seconds, and an "accounting stopped" message is sent to the RADIUS accounting server on accounting end. Note: The switch send the "user offline" message to the RADIUS accounting server only when accounting is enabled, the "user offline" message will not be sent to the RADIUS authentication server.

**Example:** Enabling AAA accounting for the switch.

```
Switch(config)#aaa-accounting enable
```

## 8.3 aaa-accounting update

**Command:** `aaa-accounting update {enable | disable}`

**Function:** Enable or disable the AAA update accounting function.

**Command Mode:** Global Mode.

**Default:** Enable the AAA update accounting function.

**Usage Guide:** After the update accounting function is enabled, the switch will sending accounting message to each online user on time.

**Example:** Disable the AAA update accounting function for switch.

```
Switch(config)#aaa-accounting update disable
```

## 8.4 debug aaa packet

**Command:** `debug aaa packet {send | receive | all} interface {ethernet <interface-number> | <interface-name>}`

`no debug aaa packet {send | receive | all} interface {ethernet <interface-number> | <interface-name>}`

**Function:** Enable the debug information of AAA about receiving and sending packets; the no operation of this command will disable such debug information.

**Parameters:** **send:** Enable the debug information of AAA about sending packets.

**receive:** Enable the debug information of AAA about receiving packets.

**all:** Enable the debug information of AAA about both sending and receiving packets.

**<interface-number>:** the number of interface.

**<interface-name>:** the name of interface.

**Command Mode:** Admin Mode.

**Usage Guide:** By enabling the debug information of AAA about sending and receiving packets, users can check the messages received and sent by Radius protocol, which might help diagnose the cause of faults if there is any.

**Example:** Enable the debug information of AAA about sending and receiving packets on interface1/0/1.

```
Switch#debug aaa packet all interface Ethernet 1/0/1
```

## 8.5 debug aaa detail attribute

**Command:** `debug aaa detail attribute interface {ethernet <interface-number> | <interface-name>}`

```
no debug aaa detail attribute interface {ethernet <interface-number> |  
<interface-name>}
```

**Function:** Enable the debug information of AAA about Radius attribute details; the no operation of this command will disable that debug information.

**Parameters:** *<interface-number>*: the number of the interface.

*<interface-name>*: the name of the interface.

**Command Mode:** Admin Mode.

**Usage Guide:** By enabling the debug information of AAA about Radius attribute details, users can check Radius attribute details of Radius messages, which might help diagnose the cause of faults if there is any.

**Example:** Enable the debug information of aaa about Radius attribute details on interface 1/0/1.

```
Switch#debug aaa detail attribute interface Ethernet 1/0/1
```

## 8.6 debug aaa detail connection

**Command:** debug aaa detail connection

```
no debug aaa detail connection
```

**Function:** Enable the debug information of aaa about connection details; the no operation of this command will disable that debug information.

**Parameters:** None.

**Command Mode:** Admin Mode.

**Usage Guide:** By enabling the debug information of aaa about connection details, users can check connection details of aaa, which might help diagnose the cause of faults if there is any.

**Example:** Enable the debug information of aaa about connection details.

```
Switch#debug aaa detail connection
```

## 8.7 debug aaa detail event

**Command:** debug aaa detail event

```
no debug detail event
```

**Function:** Enable the debug information of aaa about events; the no operation of this command will disable that debug information.

**Parameters:** None.

**Command Mode:** Admin Mode.

**Usage Guide:** By enabling the debug information of aaa about events, users can check

the information of all kinds of event generated in the operation process of Radius protocol, which might help diagnose the cause of faults if there is any.

**Example:** Enable the debug information of aaa about events.

```
Switch#debug aaa detail event
```

## 8.8 debug aaa error

**Command:** `debug aaa error`

`no debug error`

**Function:** Enable the debug information of aaa about errors; the no operation of this command will disable that debug information.

**Parameters:** None.

**Command Mode:** Admin Mode.

**Usage Guide:** By enabling the debug information of aaa about errors, users can check the information of all kinds of errors that occurs in the operation process of Radius protocol, which might help diagnose the cause of faults if there is any.

**Example:** Enable the debug information of aaa about errors.

```
Switch#debug aaa error
```

## 8.9 radius nas-ipv4

**Command:** `radius nas-ipv4 <ip-address>`

`no radius nas-ipv4`

**Function:** Configure the source IP address for RADIUS packet sent by the switch. The “no radius nas-ipv4” command deletes the configuration.

**Parameter:** `<ip-address>` is the source IP address of the RADIUS packet, in dotted decimal notation, it must be a valid unicast IP address.

**Default:** No specific source IP address for RADIUS packet is configured, the IP address of the interface from which the RADIUS packets are sent is used as source IP address of RADIUS packet.

**Command mode:** Global Mode.

**Usage guide:** The source IP address must belongs to one of the IP interface of the switch, otherwise an failure message of binding IP address will be returned when the switch send RADIUS packet. We suggest using the IP address of loopback interface as source IP address, it avoids that the packets from RADIUS server are dropped when the interface link-down.

**Example:** Configure the source ip address of RADIUS packet as 192.168.2.254.

```
Switch#radius nas-ipv4 192.168.2.254
```

## 8.10 radius nas-ipv6

**Command:** `radius nas-ipv6 <ipv6-address>`

`no radius nas-ipv6`

**Function:** Configure the source IPv6 address for RADIUS packet sent by the switch. The no command deletes the configuration.

**Parameter:** `<ipv6-address>` is the source IPv6 address of the RADIUS packet, it must be a valid unicast IPv6 address.

**Default:** No specific source IPv6 address for RADIUS packet is configured, the IPv6 address of the interface from which the RADIUS packets are sent is used as source IPv6 address of RADIUS packet.

**Command mode:** Global Mode.

**Usage guide:** The source IPv6 address must belongs to one of the IPv6 interface of the switch, otherwise a failure message of binding IPv6 address will be returned when the switch send RADIUS packet. We suggest using the IPv6 address of loopback interface as source IPv6 address, it avoids that the packets from RADIUS server are dropped when the interface link-down.

**Example:** Configure the source ipv6 address of RADIUS packet as 2001:da8:456::1.

```
Switch#radius nas-ipv6 2001:da8:456::1
```

## 8.11 radius-server accounting host

**Command:** `radius-server accounting host {<ipv4-address> | <ipv6-address>} [port <port-number>] [key {0 | 7} <string>] [primary]`

`no radius-server accounting host {<ipv4-address> | <ipv6-address>}`

**Function:** Specifies the IPv4/IPv6 address and the port number, whether be primary server for RADIUS accounting server; the no command deletes the RADIUS accounting server.

**Parameters:** `<ipv4-address> | <ipv6-address>` stands for the server IPv4/IPv6 address;

`<port-number>` for server listening port number from 0 to 65535;

`<string>` is the key string. If key option is set as 0, the key is not encrypted and its range should not exceed 64 characters, if key option is set as 7, the key is encrypted and its range should not exceed 64 characters;

**primary** for primary server. Multiple RADIUS sever can be configured and would be available. RADIUS server will be searched by the configured order if **primary** is

not configured, otherwise, the specified RADIUS server will be used first.

**Command Mode:** Global Mode

**Default:** No RADIUS accounting server is configured by default.

**Usage Guide:** This command is used to specify the IPv4/IPv6 address and port number of the specified RADIUS server for switch accounting, multiple command instances can be configured. The **<port-number>** parameter is used to specify accounting port number, which must be the same as the specified accounting port in the RADIUS server; the default port number is 1813. If this port number is set to 0, accounting port number will be generated at random and can result in invalid configuration. This command can be used repeatedly to configure multiple RADIUS servers communicating with the switch, the switch will send accounting packets to all the configured accounting servers, and all the accounting servers can be backup servers for each other. If **primary** is specified, then the specified RADIUS server will be the primary server. It only configures a RADIUS primary server whether the server use IPv4 address or IPv6 address.

**Example:** Sets the RADIUS accounting server of IPv6 address to 2004:1:2:3::2, as the primary server, with the accounting port number as 3000.

```
Switch(config)#radius-server accounting host 2004:1:2:3::2 port 3000 primary
```

## 8.12 radius-server authentication host

**Command:** radius-server authentication host {<ipv4-address> | <ipv6-address>}  
[port <port-number>] [key {0 | 7} <string>] [primary] [access-mode {dot1x | telnet}]  
no radius-server authentication host {<ipv4-address> | <ipv6-address>}

**Function:** Specifies the IPv4 address or IPv6 address and listening port number, cipher key, whether be primary server or not and access mode for the RADIUS server; the no command deletes the RADIUS authentication server.

**Parameters:** <ipv4-address> / <ipv6-address> stands for the server IPv4/IPv6 address;  
<port-number> for listening port number, from 0 to 65535, where 0 stands for non-authentication server usage;

<string> is the key string. If key option is set as 0, the key is not encrypted and its range should not exceed 64 characters, if key option is set as 7, the key is encrypted and its range should not exceed 64 characters;

**primary** for primary server. Multiple RADIUS Sever can be configured and would be available. RADIUS Server will be searched by the configured order if **primary** is not configured, otherwise, the specified RADIUS server will be used last.

**[access-mode {dot1x|telnet}]** designates the current RADIUS server only use 802.1x authentication or telnet authentication, all services can use current RADIUS

server by default.

**Command mode:** Global Mode

**Default:** No RADIUS authentication server is configured by default.

**Usage Guide:** This command is used to specify the IPv4 address or IPv6 address and port number, cipher key string and access mode of the specified RADIUS server for switch authentication, multiple command instances can be configured. The port parameter is used to specify authentication port number, which must be the same as the specified authentication port in the RADIUS server, the default port number is 1812. If this port number is set to 0, the specified server is regard as non-authenticating. This command can be used repeatedly to configure multiple RADIUS servers communicating with the switch, the configured order is used as the priority for the switch authentication server. When the first server has responded (whether the authentication is succeeded or failed), switch does not send the authentication request to the next. If **primary** is specified, then the specified RADIUS server will be the primary server. It will use the cipher key which be configured by **radius-server key <string>** global command if the current RADIUS server not configure key<string>. Besides, it can designate the current RADIUS server only use 802.1x authentication or telnet authentication via access-mode option. It is not configure access-mode option and all services can use current RADIUS server by default.

**Example:** Setting the RADIUS authentication server address as 2004:1:2:3::2.

```
Switch(config)#radius-server authentication host 2004:1:2:3::2
```

## 8.13 radius-server dead-time

**Command:** **radius-server dead-time <minutes>**

**no radius-server dead-time**

**Function:** Configures the restore time when RADIUS server is down; the “**no radius-server dead-time**” command restores the default setting.

**Parameters:** **<minute>** is the down -restore time for RADIUS server in minutes, the valid range is 1 to 255.

**Command mode:** Global Mode

**Default:** The default value is 5 minutes.

**Usage Guide:** This command specifies the time to wait for the RADIUS server to recover from inaccessible to accessible. When the switch acknowledges a server to be inaccessible, it marks that server as having invalid status, after the interval specified by this command; the system resets the status for that server to valid.

**Example:** Setting the down-restore time for RADIUS server to 3 minutes.

```
Switch(config)#radius-server dead-time 3
```

## 8.14 radius-server key

**Command:** `radius-server key {0 | 7} <string>`

`no radius-server key`

**Function:** Specifies the key for the RADIUS server (authentication and accounting); the “no radius-server key” command deletes the key for RADIUS server.

**Parameters:** `<string>` is a key string for RADIUS server, If key option is set as 0, the key is not encrypted and its range should not exceed 64 characters, if key option is set as 7, the key is encrypted and its range should not exceed 64 characters.

**Command mode:** Global Mode

**Usage Guide:** The key is used in the encrypted communication between the switch and the specified RADIUS server. The key set must be the same as the RADIUS server set, otherwise, proper RADIUS authentication and accounting will not perform properly.

**Example:** Setting the RADIUS authentication key to be “test”.

```
Switch(config)#radius-server key 0 test
```

## 8.15 radius-server retransmit

**Command:** `radius-server retransmit <retries>`

`no radius-server retransmit`

**Function:** Configures the re-transmission times for RADIUS authentication packets; the “no radius-server retransmit” command restores the default setting.

**Parameters:** `<retries>` is a retransmission times for RADIUS server, the valid range is 0 to 100.

**Command mode:** Global Mode

**Default:** The default value is 3 times.

**Usage Guide:** This command specifies the retransmission time for a packet without a RADIUS server response after the switch sends the packet to the RADIUS server. If authentication information is missing from the authentication server, AAA authentication request will need to be re-transmitted to the authentication server. If AAA request retransmission count reaches the retransmission time threshold without the server responding, the server will be considered to as not work, the switch sets the server as invalid.

**Example:** Setting the RADIUS authentication packet retransmission time to five times.

```
Switch(config)#radius-server retransmit 5
```

## 8.16 radius-server timeout

**Command:** `radius-server timeout <seconds>`

`no radius-server timeout`

**Function:** Configures the timeout timer for RADIUS server; the “`no radius-server timeout`” command restores the default setting.

**Parameters:** `<seconds>` is the timer value (second) for RADIUS server timeout, the valid range is 1 to 1000.

**Command mode:** Global Mode

**Default:** The default value is 3 seconds.

**Usage Guide:** This command specifies the interval for the switch to wait RADIUS server response. The switch waits for corresponding response packets after sending RADIUS Server request packets. If RADIUS server response is not received in the specified waiting time, the switch resends the request packet or sets the server as invalid according to the current conditions.

**Example:** Setting the RADIUS authentication timeout timer value to 30 seconds.

```
Switch(config)#radius-server timeout 30
```

## 8.17 radius-server accounting-interim-update timeout

**Command:** `radius-server accounting-interim-update timeout <seconds>`

`no radius-server accounting-interim-update timeout`

**Function:** Set the interval of sending fee-counting update messages; the no operation of this command will reset to the default configuration.

**Parameters:** `<seconds>` is the interval of sending fee-counting update messages, in seconds, ranging from 60 to 3600.

**Command Mode:** Global Mode.

**Default:** The default interval of sending fee-counting update messages is 300 seconds.

**User Guide:** This command set the interval at which NAS sends fee-counting update messages. In order to realize the real time fee-counting of users, from the moment the user becomes online, NAS will send a fee-counting update message of this user to the RADIUS server at the configured interval.

The interval of sending fee-counting update messages is relative to the maximum number of users supported by NAS. The smaller the interval, the less the maximum number of the users supported by NAS; the bigger the interval, the more the maximum number of the users supported by NAS. The following is the recommended ratio of interval of sending fee-counting update messages to the maximum number of the users supported

by NAS:

Table 8-1 The recommended ratio of the interval of sending fee-counting update messages to the maximum number of the users supported by NAS

| The maximum number of users | The interval of sending fee-counting update messages(in seconds) |
|-----------------------------|--|
| 1~299                       | 300 ( default value )  |
| 300~599                     | 600  |
| 600~1199                    | 1200   |
| 1200~1799                   | 1800   |
| ≥1800                       | 3600   |

**Example:** The maximum number of users supported by NAS is 700, the interval of sending fee-counting update messages 1200 seconds.

Switch(config)#radius-server accounting-interim-update timeout 1200

## 8.18 show aaa authenticated-user

**Command:** show aaa authenticated-user

**Function:** Displays the authenticated users online.

**Command mode:** Admin and Configuration Mode.

**Usage Guide:** Usually the administrator concerns only information about the online user, the other information displayed is used for troubleshooting by technical support.

**Example:**

Switch#show aaa authenticated-user

```

----- authenticated users -----
  UserName  Retry RadID Port EapID ChapID OnTime   UserIP      MAC
-----
----- total: 0 -----
    
```

## 8.19 show aaa authenticating-user

**Command:** show aaa authenticating-user

**Function:** Display the authenticating users.

**Command mode:** Admin and Configuration Mode.

**Usage Guide:** Usually the administrator concerns only information about the authenticating user, the other information displays is used for troubleshooting by the

technical support.

**Example:**

Switch#show aaa authenticating-user

```

----- authenticating users -----
  User-name  Retry-time  Radius-ID  Port  Eap-ID  Chap-ID  Mem-Addr  State
-----
----- total: 0 -----
    
```

## 8.20 show aaa config

**Command: show aaa config**

**Function:** Displays the configured commands for the switch as a RADIUS client.

**Command mode:** Admin and Configuration Mode.

**Usage Guide:** Displays whether aaa authentication, accounting are enabled and information for key, authentication and accounting server specified.

**Example:**

Switch#show aaa config (For Boolean value, 1 stands for TRUE and 0 for FALSE)

```

----- AAA config data -----

  Is Aaa Enabled = 1      :1 means AAA authentication is enabled, 0 means is not
enabled
  Is Account Enabled= 1   :1 means AAA account is enabled, 0 means is not enabled
  MD5 Server Key = yangshifeng   : Authentication key
  authentication server sum = 2    :Configure the number of authentication server
  authentication server[0].sock_addr = 2:100.100.100.60.1812  :The address protocol
group, IP and interface number of the first authentication server
      .Is Primary = 1      :Is the primary server
      .Is Server Dead = 0  :The server whether dead
      .Socket No = 0      :The local socket number lead to this
server
  authentication server[1].sock_addr = 10:2004:1:2::2.1812
      .Is Primary = 0
      .Is Server Dead = 0
      .Socket No = 0
  accounting server sum = 2  :Configure the number of the accounting server
    
```

accounting server[0].sock\_addr = 2:100.100.100.65.1813 :The address protocol group, IP and interface number of the accounting server

.Is Primary = 1 :Is primary server

.Is Server Dead = 0 :This server whether dead

.Socket No = 0 :The local socket number lead to this

server

accounting server[1].sock\_addr = 10:2004::7.1813

.Is Primary = 1

.Is Server Dead = 0

.Socket No = 0

Time Out = 5s :After send the require packets, wait for response time out

Retransmit = 3 :The number of retransmit

Dead Time = 5min :The tautology interval of the dead server

Account Time Interval = 0min :The account time interval

## 8.21 show radius authenticated-user count

**Command:** show radius authenticated-user count

**Function:** Show the number of on-line users who have already passed the authentication.

**Parameter:** None.

**Command mode:** Admin and configuration mode

**Default:** None.

**Usage guide:** None.

**Example:**

```
Switch#show radius authenticated-user count
```

```
The authenticated online user num is:      105
```

## 8.22 show radius authenticating-user count

**Command:** show radius authenticating-user count

**Function:** Show the number of the authenticating-user.

**Parameter:** None.

**Command mode:** Admin and configuration mode.

**Default:** None.

**Usage Guide:** None.

**Example:**

```
Switch#show radius authenticating-user count
```

The authenticating user num is: 10

## 8.23 Radius Escaping

### 8.23.1 radius-server escape { enable | disable}

**Command:** radius-server escape enable  
radius-server escape disable

**Function:** Enable the AAA radius server escaping function.

**Parameters:** None.

**Default:** Disable.

**Command Mode:** Global Mode.

**Usage Guide:** After enabled the radius server escaping function, the flow of dot1x or portal authentication client can be allowed when the configured radius server on them is inaccessible. When the configured authentication server is accessible again, the flow allowing rule will be deleted.

**Example:** Enable the global authentication function.

```
Switch (Config)# radius-server escape enable
```

### 8.23.2 radius-server escape detection-interval

**Command:** radius-server escape detection-interval {default| < second >}}

**Function:** Configure the detection interval of radius server escaping.

**Parameters:** default: the default interval is 3 minutes.

second: the interval whose range is 1-1800 seconds.

**Default:** 180s.

**Command Mode:** Global Mode.

**Usage Guide:** The shorter the configured interval is, the radius server escaping function is more flexible. The configured interval should be longer than (Retransmit+1)\* Time Out.

**Example:** Configure the detection interval of radius server escaping as 120s.

```
Switch(config)#radius-server escape detection-interval 120
```

# Chapter 9 Commands for SSL Configuration

## 9.1 ip http secure-server

**Command:** ip http secure-server

**no ip http secure-server**

**Function:** Enable/disable SSL function.

**Parameter:** None.

**Command Mode:** Global Mode.

**Default:** Disabled.

**Usage Guide:** This command is used for enable and disable SSL function. After enable SSL function, the users visit the switch through https client, switch and client use SSL connect, can form safety SSL connect channel. After that, all the data which transmit of the application layer will be encrypted, then ensure the privacy of the communication.

**Example:** Enable SSL function.

```
Switch(config)#ip http secure-server
```

## 9.2 ip http secure-port

**Command:** ip http secure-port *<port-number>*

**no ip http secure-port**

**Function:** Configure/delete port number by SSL used.

**Parameter:** *<port-number>* means configured port number, range between 1025 and 65535. 443 is for default.

**Command Mode:** Global Mode.

**Default:** Not configure.

**Usage Guide:** If this command is used to configure the port number, then the configured port number is used to monitor. If the port number for https is changed, when users try to use https to connect, must use the changed one. For example: https://device:port\_number. SSL function must reboot after every change.

**Example:** Configure the port number is 1028.

```
Switch(config)#ip http secure-port 1028
```

## 9.3 ip http secure- ciphersuite

**Command:** ip http secure-ciphersuite {des-cbc3-sha|rc4-128-sha| des-cbc-sha}  
no ip http secure-ciphersuite

**Function:** Configure/delete secure cipher suite by SSL used.

**Parameter:** **des-cbc3-sha** encrypted algorithm DES\_CBC3, summary algorithm SHA.  
**rc4-128-sha** encrypted algorithm RC4\_128, summary algorithm SHA.  
**des-cbc-sha** encrypted algorithm DES\_CBC, summary algorithm SHA.  
default use is **rc4-md5**.

**Command Mode:** Global Mode.

**Default:** Not configure.

**Usage Guide:** If this command is used to configure the secure cipher suite, specified encryption method will be used. The SSL should be restarted to take effect after changes on configuration. When des-cbc-sha is configured, IE 7.0 or above is required.

**Example:** Configure the secure cipher suite is rc4-128-sha.

```
Switch(config)# ip http secure- ciphersuite rc4-128-sha
```

## 9.4 show ip http secure-server status

**Command:** show ip http secure-server status

**Function:** Show the status for the configured SSL.

**Parameter:** None.

**Command Mode:** Admin and Configuration Mode.

**Example:**

```
Switch# show ip http secure-server status
```

```
HTTP secure server status: Enabled
```

```
HTTP secure server port: 1028
```

```
HTTP secure server ciphersuite: rc4-128-sha
```

## 9.5 debug ssl

**Command:** debug ssl

no debug ssl

**Function:** Show the configured SSL information, the no command closes the DEBUG.

**Parameter:** None.

**Command Mode:** Admin Mode.

**Example:**

```
Switch# debug ssl
%Jan 01 01:02:05 2006 ssl will to connect to web server 127.0.0.1:9998
%Jan 01 01:02:05 2006 connect to http security server success!
```

# Chapter 10 Commands for IPv6 Security RA

## 10.1 ipv6 security-ra enable

**Command:** ipv6 security-ra enable

**no ipv6 security-ra enable**

**Function:** Globally enable IPv6 security RA function, all the RA advertisement messages will not be forwarded through hardware, but only sent to CPU to handle. The no operation of this command will globally disable IPv6 security RA function.

**Parameters:** None.

**Command Mode:** Global Configuration Mode.

**Default:** The IPv6 security RA function is disabled by default.

**Usage Guide:** Only after enabling the global security RA function, the security RA on a port can be enabled. Globally disabling security RA will clear all the configured security RA ports. The global security RA function and the global IPv6 SAVI function are mutually exclusive, so they can not be enabled at the same time.

**Example:** Globally enable IPv6 security RA.

```
Switch(config)#ipv6 security-ra enable
```

## 10.2 ipv6 security-ra enable

**Command:** ipv6 security-ra enable

**no ipv6 security-ra enable**

**Function:** Enable IPv6 security RA on a port, causing this port not to forward the received RA message. The **no ipv6 security-ra enable** will disable the IPv6 security RA on a port.

**Parameters:** None.

**Command Mode:** Port Configuration Mode.

**Default:** IPv6 security RA function is disabled by default.

**Usage Guide:** Only after globally enabling the security RA function, can the security RA on a port be enabled. Globally disabling security RA will clear all the configured security RA ports.

**Example:** Enable IPv6 security RA on a port.

```
Switch(Config-If-Ethernet1/0/2)#ipv6 security-ra enable
```

## 10.3 show ipv6 security-ra

**Command:** show ipv6 security-ra [interface <interface-list>]

**Function:** Display all the interfaces with IPv6 RA function enabled.

**Parameters:** No parameter will display all distrust ports, entering a parameter will display the corresponding distrust port.

**Command Mode:** Admin and Configuration Mode.

**Example:**

```
Switch# show ipv6 security-ra
```

```
IPv6 security ra config and state information in the switch
```

```
Global IPv6 Security RA State: Enable
```

```
Ethernet1/0/1
```

```
IPv6 Security RA State: Yes
```

```
Ethernet1/0/3
```

```
IPv6 Security RA State: Yes
```

## 10.4 debug ipv6 security-ra

**Command:** debug ipv6 security-ra

**no debug ipv6 security-ra**

**Function:** Enable the debug information of IPv6 security RA; the no operation of this command will disable the debug information of IPv6 security RA.

**Command Mode:** Admin Mode.

**Parameters:** None.

**Usage Guide:** Users can check the proceeds of message handling of IPv6 security RA, which will help investigate the causes to problems if there is any.

**Example:** Enable the debug information of IPv6 security RA.

```
Switch#debug ipv security-ra
```

# Chapter 11 Commands for MAB

## 11.1 authentication mab

**Command:** authentication mab {radius|local} (none|)

**no authentication mab**

**Function:** Configure the authentication mode and priority of MAC address authentication, the no command restores the default authentication mode.

**Parameters:** radius means RADIUS authentication mode; local means the local authentication; none means the authentication is needless.

**Default:** Using RADIUS authentication mode.

**Command Mode:** Global mode

**Usage Guide:** none option is used to the fleeing function of MAC address authentication. If all configured RADIUS servers don't respond, switch will adopt none authentication mode to allow that MAC address authentication users access the network directly. The option of local is used for the local authentication of MAC address, it authenticates through the local user name and password. If configured as the method of **authentication mab radius local none**, judge if configured the user name and password used in mab authentication in local when the radius server has no response. If it has been configured, use the local authentication, if not, use the backup none authentication.

**Example:** Configure the local authentication and the fleeing function of MAC address authentication.

```
Switch(config)#authentication mab radius local none
```

## 11.2 clear mac-authentication-bypass binding

**Command:** clear mac-authentication-bypass binding {mac WORD | interface (ethernet IFNAME | IFNAME) | all}

**Function:** Clear MAB binding information.

**Parameters:** **MAC:** Delete MAB binding of the specified MAC address

**IFNAME:** Delete MAB binding of the specified port

**all:** Delete all MAB binding

**Command Mode:** Admin Mode

**Default:** None.

**Usage Guide:** None.

**Example:** Delete all MAB binding.

```
Switch#clear mac-authentication-bypass binding all
```

## 11.3 debug mac-authentication-bypass

**Command:** `debug mac-authentication-bypass {packet | event | binding}`

**Function:** Enable the debugging of the packet information, event information or binding information for MAB authentication.

**Parameters:** **packet:** Enable the debugging of the packet information for MAB authentication.

**event:** Enable the debugging of the event information for MAB authentication.

**binding:** Enable the debugging of the binding information for MAB authentication.

**Command Mode:** Admin Mode

**Default:** None.

**Usage Guide:** None.

**Example:** Enable the debugging of the packet information for MAB authentication.

```
Switch#debug mac-authentication-bypass packet
```

## 11.4 mac-authentication-bypass binding-limit

**Command:** `mac-authentication-bypass binding-limit <1-100>`

**no mac-authentication-bypass binding-limit**

**Function:** Set the max binding number of MAB. The no command will restore the default binding number as 3.

**Parameters:** `<1-100>` the max binding number of MAB, ranging from 1 to 100.

**Command Mode:** Port Mode

**Default:** The max binding number of MAB is 3.

**Usage Guide:** Set the max binding number of MAB. When the binding number reaches to the max value, the port will stop binding, if the max binding number is less than the current binding number of the port, the setting will be unsuccessful.

**Example:** Configure the max binding number as 10.

```
Switch(Config)#interface ethernet 1/0/1
```

```
Switch(Config-If-Ethernet1/0/1)#mac-authentication-bypass binding-limit 10
```

## 11.5 mac-authentication-bypass enable

**Command:** `mac-authentication-bypass enable`

`no mac-authentication-bypass enable`

**Function:** Enable the global and port MAB function. The no command disables MAB function.

**Parameters:** None.

**Command Mode:** Global Mode and Port Mode

**Default:** Disable the global and port MAB function.

**Usage Guide:** To process MAB authentication of a port, enable the global MAB function first, and then, enable the MAB function of the corresponding port.

**Example:** Enable the global and port Eth1/0/1 MAB function.

```
Switch(Config)#mac-authentication-bypass enable
```

```
Switch(Config)#interface ethernet 1/0/1
```

```
Switch(Config-If-Ethernet1/0/1)#mac-authentication-bypass enable
```

## 11.6 mac-authentication-bypass guest-vlan

**Command:** `mac-authentication-bypass guest-vlan <1-4094>`

`no mac-authentication-bypass guest-vlan`

**Function:** Set guest vlan of MAB authentication. The no command deletes guest vlan.

**Parameters:** `<1-4094>`: guest vlan ID, ranging from 1 to 4094.

**Command Mode:** Port Mode

**Default:** None.

**Usage Guide:** Set guest vlan of MAB authentication, only Hybrid port use this command, it is not take effect on access port. After MAB authentication is failing, if the existent guest vlan is configured by the port connecting to the MAB user, the MAB user can join and access guest vlan.

**Example:** Configure guest vlan of MAB authentication for port 1/0/1

```
Switch(Config)#interface ethernet 1/0/1
```

```
Switch(config-If-Ethernet1/0/1)#mac-authentication-bypass guest-vlan 10
```

## 11.7 mac-authentication-bypass spoofing-garp-check

**Command:** `mac-authentication-bypass spoofing-garp-check enable`

`no mac-authentication-bypass spoofing-garp-check enable`

**Function:** Enable the spoofing-garp-check function, MAB function will not deal with

spoofing-garp any more; the no command disables the function.

**Parameters:** None.

**Command Mode:** Global Mode

**Default:** Disable spoofing-garp-check function.

**Usage Guide:** When the terminal of Windows operating system detects the address conflict, it will sends a gratuitous ARP to correct the error ARP entries generated by gratuitous ARP of the conflict detection. This command is used to detect the spoofing-garp when occurring the address conflict, MAB function is not deal with the packet any more. Notice: when enabling the check function, all ARP will be processed the software check, it will add switch's load.

**Example:** Enable spoofing-garp-check function.

```
Switch(Config)#mac-authentication-bypass spoofing-garp-check enable
```

## 11.8 mac-authentication-bypass timeout linkup-period

**Command:** mac-authentication-bypass timeout linkup-period <0-30>

**no mac-authentication-bypass timeout linkup-period**

**Function:** Set the interval between down and up when VLAN binding in a port is changing to assure the user can obtain IP again.

**Parameters:** <0-30>: After the port is shutdown automatically, the interval before it up again, the unit is second, 0 means there is no down/up operation.

**Command Mode:** Global Mode

**Default:** The interval is 0.

**Usage Guide:** When MAB authentication is successful, belong to vlan according to auto-vlan setting, when MAB authentication is failing, belong to vlan according to guest-vlan setting. After linkup-period is set, when VLAN binding of a port is changing, the port will be shutdown automatically, and will be up again after linkup-period to assure the client obtain IP.

**Example:** Configure down/up time as 12s.

```
Switch(Config)#mac-authentication-bypass timeout linkup-period 12
```

## 11.9 mac-authentication-bypass timeout offline-detect

**Command:** mac-authentication-bypass timeout offline-detect (0 | <60-7200>)

**no mac-authentication-bypass timeout offline-detect**

**Function:** Configure offline-detect time. The no command restores the default value.

**Parameters:** (0 | <60-7200>): offline-detect time, the range is 0 or 60 to 7200s.

**Command Mode:** Global Mode

**Default:** offline-detect time is 180s.

**Usage Guide:** When offline-detect time is 0, the switch does not detect MAB binding, when offline-detect time is 60s to 7200s, the switch timely detects the flow corresponding to the MAB binding. If there is no flow in the period of offline-detect time, it will delete this binding and forbid the flow to pass.

**Example:** Configure offline-detect time as 200s.

```
Switch(Config)#mac-authentication-bypass timeout offline-detect 200
```

## 11.10 mac-authentication-bypass timeout quiet-period

**Command:** `mac-authentication-bypass timeout quiet-period <1-60>`

`no mac-authentication-bypass timeout quiet-period`

**Function:** Set quiet-period of MAB authentication. The no command restores quiet-period as the default value.

**Parameters:** `<1-60>`: quiet-period, ranging from 1 to 60s.

**Command Mode:** Global Mode

**Default:** quiet-period is 30s.

**Usage Guide:** If MAB authentication is failing, within the quiet-period the switch will not respond the authentication request of this MAC, after quiet-period, it will respond the request again.

**Example:** Configure quiet-period of MAB authentication as 60s.

```
Switch(Config)#mac-authentication-bypass timeout quiet-period 60
```

## 11.11 mac-authentication-bypass timeout reauth-period

**Command:** `mac-authentication-bypass timeout reauth-period <1-3600>`

`no mac-authentication-bypass timeout reauth-period`

**Function:** Set the reauthentication interval at failing authentication state. The no command restores the default value.

**Parameters:** `<1-3600>`: reauthentication interval, ranging from 1 to 3600s.

**Command Mode:** Global Mode

**Default:** reauthentication interval is 30s.

**Usage Guide:** At failing authentication state, the user processes the reauthentication timely until the authentication is successful; at the successful state, the user can access the network resources.

**Example:** Configure reauthentication time as 20s.

```
Switch(Config)#mac-authentication-bypass timeout reauth-period 20
```

## 11.12 mac-authentication-bypass timeout stale-period

**Command:** `mac-authentication-bypass timeout stale-period <0-60>`

**no mac-authentication-bypass timeout stale-period**

**Function:** Set the time that delete the binding user after MAB port is down. The no command restores the default value.

**Parameters:** `<1-60>`: The time that delete the binding, ranging from 0 to 60s.

**Command Mode:** Global Mode

**Default:** 30s.

**Usage Guide:** If the time that delete the binding as 0, delete all user binding of this port as soon as the MAB port is down, if the time is bigger than 0, delete the user binding with a delay after the MAB port is down.

**Example:** Configure the deletion time as 40s.

```
Switch(Config)#mac-authentication-bypass timeout stale-period 40
```

## 11.13 mac-authentication-bypass username-format

**Command:** `mac-authentication-bypass username-format {mac-address | {fixed username WORD password WORD}}`

**Function:** Set the authenticate method of MAB authentication.

**Parameters:** **mac-address:** Use MAC address of MAB user as username and password to authenticate.

**fixed username WORD password WORD:** Use the specified username and password to authenticate, the length of username and password ranges between 1 and 32 characters.

**Command Mode:** Global Mode

**Default:** Use MAC address of MAB user as username and password to authenticate.

**Usage Guide:** There are two methods for MAB authentication: use MAC address of MAB user as username and password to authenticate or use the specified username and password to authenticate. If there is no specified username and password, the device uses the first method to authenticate by default.

**Example:** All MAB users use the same username and password to authenticate, the username is mab-user, the password is mab-pwd.

```
Switch(Config)#mac-authentication-bypass username-format fixed username mab-user
```

password mab-pwd

### 11.14 show mac-authentication-bypass

**Command:** show mac-authentication-bypass {interface {ethernet IFNAME | IFNAME} |}

**Function:** Show the binding information of MAB authentication.

**Parameters:** interface {ethernet IFNAME|IFNAME}: The port name.

**Command Mode:** Admin Mode

**Default:** None.

**Usage Guide:** None.

**Example:** Show the binding information of all MAB users.

Switch#show mac-authentication-bypass

The Number of all binding is 5

| MAC               | Interface     | Vlan ID | State             |
|-------------------|---------------|---------|-------------------|
| 05-0a-eb-6a-7f-88 | Ethernet1/0/1 | 1       | MAB_QUIET         |
| 04-0a-eb-6a-7f-88 | Ethernet1/0/1 | 1       | MAB_QUIET         |
| 03-0a-eb-6a-7f-88 | Ethernet1/0/1 | 1       | MAB_QUIET         |
| 02-0a-eb-6a-7f-88 | Ethernet1/0/1 | 1       | MAB_AUTHENTICATED |
| 00-0a-eb-6a-7f-8e | Ethernet1/0/1 | 1       | MAB_AUTHENTICATED |

| Displayed information     | Explanation   |
|---------------------------|---|
| The Number of all binding | The binding number of all MAB users, include the successful authentication user and the failing authentication user at quiet-period state |
| MAC                       | MAC address   |
| Interface                 | The binding port  |
| Vlan                      | The VLAN that MAB user belongs  |
| State                     | Authentication state  |

Switch(config)#show mac-authentication-bypass int e1/0/1

Interface Ethernet1/0/1 user config:

MAB enable: Enable

Binding info: 1

-----

MAB Binding built at SUN JAN 01 01:14:48 2006

VID 1, Port: Ethernet1/1

Client MAC: 00-0a-eb-6a-7f-8e

Binding State: MAB\_AUTHENTICATED

Binding State Lease: 164 seconds left

| Displayed information | Explanation                                  |
|-----------------------|--|
| MAB enable            | MAB function enabled or not                  |
| Binding info          | The MAB binding number of the specified port |
| MAB Binding built at  | The time when the user binding was created   |
| VID                   | The VLAN that MAB user belongs               |

| Binding State         | Authentication state                         |
| Binding State Lease   | Remain time before the binding release       |

# Chapter 12 Commands for PPPoE Intermediate Agent

## 12.1 debug pppoe intermediate agent packet {receive | send} interface ethernet <interface-name>

**Command:** debug pppoe intermediate agent packet (receive | send) interface ethernet <interface-name>

**no debug pppoe intermediate agent packet (receive | send) interface ethernet <interface-name>**

**Function:** Enable PPPoE packet debug for the specified port, the no command disables it.

**Parameter:** receive: Enable the debug that receive PPPoE packet.

send: Enable the debug that send PPPoE packet.

ehernet: Physical port

interface-name: Port name

**Command Mode:** Admin mode

**Default:** Disable PPPoE packet debug for the specified port.

**Usage Guide:** Enable PPPoE packet debug for the specified port to show PPPoE packet received and sent by this port.

**Example:** Enable PPPoE intermediate debug for port ethernet1/0/2.

```
Switch#debug pppoe intermediate agent packet send interface ethernet 1/0/2
```

## 12.2 pppoe intermediate-agent

**Command:** pppoe intermediate-agent

**no pppoe intermediate-agent**

**Function:** Enable global PPPoE intermediate agent function. The no command disables global PPPoE intermediate agent function.

**Parameter:** None.

**Command Mode:** Global mode.

**Default:** Disable global PPPoE intermediate agent function.

**Usage Guide:** After enable global PPPoE IA function, process the packet of PPPoE discovery stage according to the related configuration.

**Example:** Enable global PPPoE intermediate agent function.

```
Switch(config)#pppoe intermediate agent
```

## 12.3 pppoe intermediate-agent (Port)

**Command:** pppoe intermediate-agent

**no pppoe intermediate-agent**

**Function:** Enable PPPoE intermediate agent function of the port. The no command disables PPPoE intermediate agent function of the port.

**Parameter:** None.

**Command Mode:** Port mode

**Default:** Disable PPPoE intermediate agent function of the port.

**Usage Guide:** After enable PPPoE IA function of the port, add vendor tag for PPPoE packet of the port.

**Note:** 1. It must enable global pppoe intermediate-agent function.

2. At least one port is connected to PPPoE server, and the port mode is trust.

**Example:** Enable PPPoE intermediate agent function of the port ethernet 1/0/2.

```
Switch(config-if-ethernet1/0/2)#pppoe intermediate agent
```

## 12.4 pppoe intermediate-agent circuit-id

**Command:** pppoe intermediate-agent circuit-id <string>

**no pppoe intermediate-agent circuit-id <string>**

**Function:** Configure circuit ID of the port, the no command cancels this configuration.

**Parameter:** <string>: circuit-id, the max character number is 63 bytes.

**Command Mode:** Port mode

**Default:** This configuration is null.

**Usage Guide:** This command configures circuit-id alone for each port, the priority is higher than pppoe intermediate-agent identifier-string command.

**Example:** Configure circuit-id as abcd/efgh on port ethernet1/0/3 of vlan3.

```
Switch(config-if-ethernet1/0/3)#pppoe intermediate-agent circuit-id abcd/efgh
```

After port ethernet1/0/3 of vlan3 receives PPPoE packet, circuit-id value of the added vendor tag as "abcd/efgh".

## 12.5 pppoe intermediate-agent delimiter

**Command:** `pppoe intermediate-agent delimiter <WORD>`

`no pppoe intermediate-agent delimiter`

**Function:** Configure the delimiter among the fields in circuit-id and remote-id, the no command cancels the configuration.

**Parameter:** <WORD>: the delimiter, its range is (#|.|.|:|/|space).

**Command Mode:** Global mode

**Default:** The fields is comparted with '\0'.

**Usage Guide:** After configuring the delimiter, the added fields of circuit-id and remote-id use the configured delimiter to compart. Notice: The global **pppoe intermediate-agent** function must be enabled.

**Example:** Configure the delimiter.

```
Switch(config)#pppoe intermediate-agent delimiter space
```

## 12.6 pppoe intermediate-agent format

**Command:** `pppoe intermediate-agent format (circuit-id | remote-id) (hex | ascii)`

`no pppoe intermediate-agent format (circuit-id | remote-id)`

**Function:** Configure the format with hex or ASCII for circuit-id and remote-id, the no command cancels the configuration.

**Parameter:** hex: hexadecimal

ascii: ASCII code

**Command Mode:** Global mode

**Default:** This configuration is null.

**Usage Guide:** Encapsulation circuit-id and remote-id with hex ASCII format to vendor tag.

Notice: The global **pppoe intermediate-agent** function must be enabled.

**Example:** Configure the trust port 1/0/1 to enable vendor-tag strip function.

```
Switch(config)#pppoe intermediate-agent format remote-id ascii
```

## 12.7 pppoe intermediate-agent remote-id

**Command:** `pppoe intermediate-agent remote-id <string>`

`no pppoe intermediate-agent remote-id <string>`

**Function:** Configure remote-id of the port, the no command cancels this configuration.

**Parameter:** <string>: remote-id, the max character number is 63 bytes.

**Command Mode:** Port mode

**Default:** This configuration is null.

**Usage Guide:** Configure remote-id for each port, if there is no configuration, use switch's MAC as remote-id value.

**Example:** Configure remote-id as abcd on port ethernet1/0/2.

```
Switch(config-if-ethernet1/0/2)# pppoe intermediate-agent remote-id abcd
```

## 12.8 pppoe intermediate-agent trust

**Command:** pppoe intermediate-agent trust

**no pppoe intermediate-agent trust**

**Function:** Configure the port as trust port, the no command configures the port as untrust port.

**Parameter:** None.

**Command Mode:** Port mode

**Default:** Untrust port.

**Usage Guide:** The port which connect to server must be configured as trust port. Note: At least one trust port is connected to PPPoE server.

**Example:** Configure port ethernet1/0/1 as trust port.

```
Switch(config-if-ethernet1/0/1)#pppoe intermediate-agent trust
```

## 12.9 pppoe intermediate-agent type self-defined circuit-id

**Command:** pppoe intermediate-agent type self-defined circuit-id {vlan | port | id  
(switch-id (mac | hostname) | remote-mac) | string WORD}

**no pppoe intermediate-agent type self-defined circuit-id**

**Function:** Configure the self-defined circuit-id, the no command cancels the configuration.

**Parameter:** vlan: VLAN ID

port: Port ID

id switch-id mac: the local MAC address

id switch-id hostname: the local host name

id remote-mac: the remote MAC address

string WORD: the specified keyword

**Command Mode:** Global mode

**Default:** This configuration is null.

**Usage Guide:** This configuration and type tr-101 circuit-id are mutually exclusive, it will

clear the corresponding configuration of type tr-101 circuit-id.

**Example:** Configure the self-defined circuit-id as vlan port id switch-id hostname.

```
Switch(config)#pppoe intermediate-agent type self-defined circuit-id vlan port id switch-id  
hostname
```

## 12.10 pppoe intermediate-agent type self-defined

### remoteid

**Command:** pppoe intermediate-agent type self-defined remoteid {mac | vlan-mac | hostname | string WORD}

**no pppoe intermediate-agent type self-defined remote-id**

**Function:** Configure the self-defined remote-id, the no command cancels the configuration.

**Parameter:** mac: Ethernet port MAC address

vlan-mac: IP interface MAC address

hostname: the local host name

string WORD: the specified keyword

**Command Mode:** Global mode

**Default:** This configuration is null.

**Usage Guide:** Configuration order of this command according to the fields order in remote-id.

**Example:** Configure the self-defined remote-id as string abcd mac hostname.

```
Switch(config)#pppoe intermediate-agent type self-defined remote-id string abcd mac  
hostname
```

## 12.11 pppoe intermediate-agent type tr-101 circuit-id

### access-node-id

**Command:** pppoe intermediate-agent type tr-101 circuit-id access-node-id <string>

**no pppoe intermediate-agent type tr-101 circuit-id access-node-id**

**Function:** Configure access-node-id field value of circuit ID in the added vendor tag with tr-101 standard.

**Parameter:** <string>: access-node-id, the max character number is 47 bytes.

**Command Mode:** Global mode

**Default:** MAC address of the switch

**Usage Guide:** Use this configuration to create access-node-id of circuit ID in vendor tag.

circuit-id value is access-node-id +” eth “+ Slot ID + delimiter + Port Index + delimiter + Vlan ID, access-node-id occupies n bytes (n<48), “ eth “ is space + e + t + h + space, it occupies 5 bytes, Slot ID occupies 2 bytes, Port Index occupies 3 bytes, Vlan ID occupies 4 bytes, delimiter occupies 1 byte. In default state, access-node-id value of circuit-id is switch’s MAC, it occupies 6 bytes. For example: MAC address is “0a0b0c0d0e0f”, Slot ID is 12, Port Index is 34, Vlan ID is 567, the default circuit-id value is “0a0b0c0d0e0f eth 12/034:0567”.

**Example:** Configure access-node-id value of circuit ID as abcd in vendor tag.

```
Switch(config)#pppoe intermediate-agent access-node-id abcd
```

After port ethernet1/0/3 of vlan3 receives PPPoE packets, circuit-id value of the added vendor tag is "abcd eth 01/003:0003".

## 12.12 pppoe intermediate-agent type tr-101 circuit-id identifier-string option delimiter

**Command:** pppoe intermediate-agent type tr-101 circuit-id identifier-string <string>  
option {sp | sv | pv | spv} delimiter <WORD> [delimiter <WORD>]

**no pppoe intermediate-agent type tr-101 circuit-id identifier-string  
option delimiter**

**Function:** Configure circuit-id of the added vendor tag with tr-101 standard, the no command deletes this configuration.

**Parameter:** <string>: identifier-string, the max character number is 47 bytes.

{sp | sv | pv | spv}: This option can select the combination format for slot, port, vlan, sp means slot and port, sv means slot and vlan, pv means port and vlan, spv means slot, port and vlan.

<WORD>: The delimiter between slot, port and vlan, the range is (# | . | , | ; | : | / | space). Note: There are two delimiter WORDs in spv combo mode, the first between slot and port, the second between port and vlan.

**Command Mode:** Global mode

**Default:** This configuration is null.

**Usage Guide:** This command is used to configure global circuit id, the priority is higher than pppoe intermediate-agent access-node-id command. circuit-id value is access-node-id +” eth “+ Slot ID + delimiter + Port Index + delimiter + Vlan ID, access-node-id occupies n bytes (n<48), “ eth “ is space + e + t + h + space, it occupies 5 bytes, Slot ID occupies 2 bytes, Port Index occupies 3 bytes, Vlan ID occupies 4 bytes, delimiter occupies 1 byte.

**Example:** Configure access-node-id as xyz, use spv combination mode, delimiter with

"#"between Slot ID and Port ID, delimiter with "/"between Port ID and Vlan ID.

```
Switch(config)#pppoe intermediate-agent identifier-string xyz option spv delimiter #  
delimiter /
```

```
Switch# show pppoe intermediate-agent identifier-string option delimiter
```

```
config identifier string is : xyz
```

```
config option is : slot , port and vlan
```

```
the first delimiter is : "# "
```

```
the second delimiter is : "/"
```

After port ethernet1/0/3 of vlan3 receives PPPoE packets, circuit-id value of the added vendor tag is "xyz eth 01#003/0003".

## 12.13 pppoe intermediate-agent vendor-tag strip

**Command:** pppoe intermediate-agent vendor-tag strip

**no pppoe intermediate-agent vendor-tag strip**

**Function:** Enable vendor-tag strip function of the port, the no command cancels this function.

**Parameter:** None.

**Command Mode:** Port mode

**Default:** Disable vendor-tag strip function of the port.

**Usage Guide:** If the received packet includes vendor tag from server to client, strip this vendor tag.

**Note:** 1. Must enable global pppoe intermediate-agent function.

2. It must be configured on trust port.

**Example:** Trust port ethernet1/0/1 enables vendor tag strip function.

```
Switch(config-if-ethernet1/0/1)#pppoe intermediate-agent trust
```

```
Switch(config-if-ethernet1/0/1)#pppoe intermediate-agent vendor-tag strip
```

## 12.14 show pppoe intermediate-agent access-node-id

**Command:** show pppoe intermediate-agent access-node-id

**Function:** Show the configured access node ID.

**Parameter:** None.

**Command Mode:** Admin mode

**Default:** The configuration information is null.

**Usage Guide:** This command is used to show access-node-id configured by user.

**Example:** Show access-node-id configuration information.

```
Switch#pppoe intermediate-agent access-node-id abcd
Switch#show pppoe intermediate-agent access-node-id
pppoe intermediate-agent access-node-id is : abcd
```

## 12.15 show pppoe intermediate-agent identifier-string option delimiter

**Command:** show pppoe intermediate-agent identifier-string option delimiter

**Function:** Show the configured identifier-string, the combination format and delimiter of slot, port and vlan.

**Parameter:** None.

**Command Mode:** Admin mode

**Default:** The configuration information is null.

**Usage Guide:** Show the configured identifier-string, the combo format and delimiter of slot, port and vlan.

**Example:** Show the configuration information for pppoe intermediate-agent identifier-string.

```
Switch#pppoe intermediate-agent identifier-string abcd option spv delimiter # delimiter /
Switch# show pppoe intermediate-agent identifier-string option delimiter
config identifier string is : abcd
config option is : slot , port and vlan
the first delimiter is : "# "
the second delimiter is : "/" "
```

## 12.16 show pppoe intermediate-agent info

**Command:** show pppoe intermediate-agent info [interface ethernet <interface-name>]

**Function:** Show the related PPPoE IA configuration information of all ports or the specified port.

**Parameter:** ethernet: physical port  
interface-name: port name

**Command Mode:** Admin mode

**Default:** The configuration information is null.

**Usage Guide:** Check the configuration information of the corresponding port, show whether the port is trust port, strip function is enabled, rate limit is enabled, show the configured circuit ID and remote ID.

**Example:** Show pppoe intermediate-agent configuration information of port ethernet1/0/2.

Switch# show pppoe intermediate-agent info interface ethernet 1/0/2

| Interface     | IA    | Trusted | vendor Strip | Rate limit | circuit id  | remote id |
|---------------|-------|---------|--------------|------------|-------------|-----------|
| -----         | ----- | -----   | -----        | -----      | -----       | -----     |
| Ethernet1/0/2 | yes   | no      | no           | no         | test1/port1 | host1     |

# Chapter 13 Commands for Captive Portal Authentication

## 13.1 Commands for Authentication Function

### 13.1.1 ac-name

**Command:** ac-name <word>

**no ac-name**

**Function:** Configure the parameter of acname in the redirect url. The no command deletes it.

**Parameters:** <word>, it is the value of acname including 32 characters at most.

**Command Mode:** Captive Portal Instance Mode.

**Default:** None.

**Usage Guide:** This command is used to configure the parameter of acname in the redirect url. Some portal servers can pass the authentication only with the specific ac-name. So this command should be configured according to the requirement of the portal server.

**Example:** Configure the ac-name in the redirect url as 0100.0010.010.00 according to the standard of the mobile portal server, and the format is ACN.CTY.PRO.OPE.

```
Switch(config-cp-instance)#ac-name 0100.0010.010.00
```

### 13.1.2 authentication roam enable

**Command:** authentication roam enable <vlan WORD>

**no authentication roam enable <vlan WORD>**

**Function:** Enable the user roaming function. The no command disables this function.

**Parameters:** vlan WORD: the specific vlan is allowed roaming.

**Command Mode:** captive portal configuration mode.

**Default:** Disable.

**Usage Guide:** After enabled this function, the user is allowed roaming. When a user roams from one port to another (the same VLAN), the roaming will be triggered. User can visit the network resources without reauthentication. After disabled this function, the user is not allowed roaming. When a user roams from one port to another, the reauthentication is needed for visiting the network resources.

**Example:** Enable the roaming function of vlan10.

```
Switch (config-cp)#authentication roam enable vlan 10
```

### 13.1.3 captive-portal

**Command:** `captive-portal`

**Function:** Use this command to enter Captive Portal configuration mode.

**Parameter:** None.

**Default:** None.

**Command Mode:** Global configuration mode.

**Usage Guide:** Use this command to enter Captive Portal configuration mode.

**Example:** Enter into the global configuration mode for configuring.

```
Switch(config)#captive-portal
```

### 13.1.4 captive-portal binding arp (it is not supported currently)

**Command:** `captive-portal binding arp`  
`no captive-portal binding arp`

**Function:** After enabled static arp binding function, a static arp will be bound for the user after the successful authentication. After user is down line, delete the bound static arp. The no command deletes the bound static arp and it will not be bound after the user is on line.

**Parameters:** None.

**Default:** None.

**Command Mode:** captive portal mode.

**Usage Guide:** Enter into the captive portal mode by using this command.

**Example:** Enter into the captive portal mode and configure it.

```
Switch (config)# captive-portal binding arp
```

### 13.1.5 captive-portal client deauthenticate

**Command:** `captive-portal client deauthenticate {<1-10> | <FF-FF-FF-FF-FF-FF> { ipv4 | ipv6} <ip-addr>}`

**Function:** Deauthenticate the specific Captive Portal client.

**Parameters:** <1-10> is the ID of Captive Portal;

<FF-FF-FF-FF-FF-FF> is the MAC address of client;

ipv4 is the ipv4 address of user;

ipv6 is the ipv6 address of user;

<ip-addr> is the user address, ipv4 address is dotted decimal format, ipv6 address is the format of X:X::X:X.

**Default:** None.

**Command Mode:** Admin Mode.

**Usage Guide:** Deauthenticate the specific Captive Portal client with the specific MAC address, it can also deauthenticate all the users or a single user under the specific captive portal configuration. When there is no parameters, deauthenticate all users.

**Example:** Deauthenticate the specific Captive Portal client

Switch #captive-portal client deauthenticate (force all the portal users on this controller get down the line)

The specified clients will be deauthenticated. Are you sure you want to deauthenticated clients? [Y/N]

Switch #captive-portal client deauthenticate 1 (force all the users of instance 1 get down the line)

Switch #captive-portal client deauthenticate 34-08-04-30-07-ca ipv4 100.1.1.1 (force one user get down the line)

### 13.1.6 captive-portal client re-auth log { enable | disable }

**Command:** captive-portal client re-auth log enable  
captive-portal client re-auth log disable

**Function:** When the port, vlan or mac of the user is changed and it needs the reauthentication, the command of show logging buffer can record the log. The no command means not to record the log when reauthenticating.

**Parameters:** None.

**Default:** Disable.

**Command Mode:** captive portal mode.

**Usage Guide:** When the port, vlan or mac of the user is changed and it needs the reauthentication, the command of show logging buffer can record the log.

**Example:** Switch (config-cp)# captive-portal client re-auth log enable

### 13.1.7 captive-portal client keep-alive flow-detection enable

**Command:** captive-portal client keep-alive flow-detection enable

**no captive-portal client keep-alive flow-detection enable**

**Function:** Enable the keep-alive function of user. The no command disables this function.

**Parameters:** None.

**Default:** Disable.

**Command Mode:** captive portal mode.

**Usage Guide:** After enabled this function, it can keep alive for the user when the user is on line.

**Example:** Enter into the captive portal mode and configure it.

```
Switch (config-cp)#captive-portal client keep-alive flow-detection enable
```

## 13.1.8 captive-portal client keep-alive flow-detection interval

**Command:** **captive-portal client keep-alive flow-detection interval <3-120>**

**no captive-portal client keep-alive flow-detection interval**

**Function:** Configure the inquiring interval of user keep-alive. The no command configures the interval to be the default value.

**Parameters:** <3-120>: the range is 3-120 minutes.

**Default:** 5 minutes.

**Command Mode:** captive portal mode.

**Usage Guide:** After configured this command, the keep-alive timer inquires the user online status every once in a interval.

**Example:** Enter into the captive portal mode and configure it.

```
Switch (config-cp)# captive-portal client keep-alive flow-detection interval 3
```

## 13.1.9 captive-portal client keep-alive flow-detection number

**Command:** **captive-portal client keep-alive flow-detection number <1-10>**

**no captive-portal client keep-alive flow-detection number**

**Function:** Configure the times of continuous failed query that the keep-alive timer is allowed. The no command configures it to be the default value.

**Parameters:** <1-10>: the range is from 1 to 10.

**Default:** 3 times.

**Command Mode:** captive portal mode.

**Usage Guide:** After configured this command, the keep-alive timer can inquire the user online status for configured times, if the user is no online always, it judges the user is down the line. Otherwise, the user is online once in the times of query, it judges the user is

online. The times will be configured again.

**Example:** Enter into the captive portal mode and configure it.

```
Switch (config-cp)# captive-portal client keep-alive flow-detection interval 3
```

### 13.1.10 clear

**Command:** clear

**Function:** This command sets the configuration of the instance to be the default value.

**Parameter:** None.

**Default:** None.

**Command Mode:** Captive Portal Instance configuration mode.

**Usage Guide:** Set the configuration of the portal instance to be the default value.

**Example:** Set the configuration of the instance to be the default value.

```
Switch(config-cp-instance)# clear
```

### 13.1.11 configuration

**Command:** configuration <cp-id>

no configuration <cp-id>

**Function:** Use this command to enter Captive Portal instances Mode. The no command will delete the Portal Captive instance configuration..

**Parameter:** <cp-id> is the number of Captive Portal instances, range is 1 to 10.

**Default:** None.

**Command Mode:** Captive Portal global configuration mode.

**Usage Guide:** This configuration is used to configure Captive Portal instances. Each instance represents a class of users, users under the same instance have the same flow and rate configuration, etc., and vice versa. No command will delete a captive portal configuration. If there is an interface associated with a instance, then the no command will be invalid.

**Example:** Set the ID parameter as 4.

```
Switch(config-cp)#configuration 4
```

### 13.1.12 debug captive-portal packet

**Command:** debug captive-portal packet {send|receive|all}

no debug captive-portal packet {send|receive|all}

**Function:** Enable the packet debugging on-off of the captive portal authentication. The no command disables it.

**Parameters:** send: enables the debugging information of sending packet of captive portal;  
receive: enables the debugging information of receiving packet of captive portal;  
all: enables the debugging information of sending, receiving and dumping packet of captive portal.

**Command Mode:** Admin Mode.

**Default:** Disable.

**Usage Guide:** This command is used to enable the packet debugging on-off of the captive portal authentication.

**Example:** Enable all the packets debugging information of the captive portal authentication.

```
Switch#debug captive-portal packet all
```

### 13.1.13 debug captive-portal trace

**Command:** debug captive-portal trace

no debug captive-portal trace

**Function:** Enable the tracing debugging of the captive portal authentication. The no command disables it.

**Parameters:** None.

**Command Mode:** Admin Mode.

**Default:** Disable.

**Usage Guide:** This command is used to enable the tracing debugging of the captive portal authentication.

**Example:** Enable the tracing debugging of the captive portal authentication.

```
Switch#debug captive-portal trace
```

### 13.1.14 debug captive-portal alive-detail

**Command:** debug captive-portal alive-detail

no debug captive-portal alive-detail

**Function:** It is the detailed debug information of portal authentication keep-alive.

**Parameters:** None.

**Default:** None.

**Command Mode:** Admin Mode.

**Example:** Switch#debug captive-portal alive-detail

### 13.1.15 debug captive-portal alive-status

**Command:** debug captive-portal alive-status

**no debug captive-portal alive-status**

**Function:** It is the debug information of portal authentication keep-alive status.

**Parameters:** None.

**Default:** None.

**Command Mode:** Admin Mode.

**Example:** Switch#debug captive-portal alive-status

### 13.1.16 debug captive-portal alive-time

**Command:** debug captive-portal alive-time

**no debug captive-portal alive-time**

**Function:** It is the debug information of portal authentication keep-alive time.

**Parameters:** None.

**Default:** None.

**Command Mode:** Admin Mode.

**Example:** Switch#debug captive-portal alive-time

### 13.1.17 debug captive-portal error

**Command:** debug captive-portal error

**no debug captive-portal error**

**Function:** Enable the error debugging of the captive portal authentication. The no command disables it.

**Parameters:** None.

**Command Mode:** Admin Mode.

**Default:** Disable.

**Usage Guide:** This command is used to enable the error debugging of the captive portal authentication.

**Example:** Enable the error debugging of the captive portal authentication.

Switch#debug captive-portal error

### 13.1.18 enable (global)

**Command:** enable

**disable**

**Function:** Use this command to enable the Captive Portal function of the controller globally, use disable function to disable the Captive Portal function of the controller

globally.

**Parameter:** None.

**Default:** Disable.

**Command Mode:** Captive Portal global configuration mode.

**Usage Guide:** Use this command to enable global Captive Portal characteristics on the controller.

**Example:** Enable the global Captive Portal function on the controller.

```
Switch(config-cp)#enable
```

### 13.1.19 enable (instance)

**Command:** enable

disable

**Function:** Enable Captive Portal configuration.

**Parameter:** None.

**Default:** Enable Captive Portal configuration.

**Command Mode:** Captive Portal Instance configuration mode.

**Usage Guide:** **disable** command will disable the captive-portal function, after disabling this command, the portal users will be forced offline.

**Example:** Enable captive-portal function.

```
Switch(config-cp-instance)#enable
```

### 13.1.20 external portal-server server-name

**Command:** external portal-server server-name <name> {ipv4 | ipv6} <ipaddr> [port <1-65535>]

no external portal-server {ipv4 | ipv6}server-name <name>

**Function:** Configure the external portal server. Launch the redirect page through this server, after inputting the correct user name and password, the authentication is successful and the client can access the outside network.

**Parameter:** <name> is name of external portal server.

<ipaddr> is ip address of external portal server.

ipv4 the configured portal server address is ipv4 address.

ipv6 the configured portal server address is ipv6 address.

<1-65535> is number of portal server.

**Default:** None.

**Command Mode:** Captive Portal global configuration mode.

**Usage Guide:** Configure external portal servers, 10 can be configured at most. Each cp

configuration can be bound to one portal server.

**Example:** Configure a external portal server.

```
Switch(config-cp)# external portal-server server-name x1 ipv4 1.0.0.1 port 11111
```

### 13.1.21 http-redirect-filter <1-32> {ip A.B.C.D| domain WORD}

**Command:** http-redirect-filter <1-32> {ip A.B.C.D| domain WORD}  
no http-redirect-filter (<1-32>|all)

**Function:** Appoint the IP or domain name for the HTTP redirection of portal authentication. Only the HTTP packet with this IP or domain name can be redirected. The no command deletes the domain name or ip address. The http packet with the mac which is not authenticated will be redirected to the portal server.

**Parameters:** <1-32>: the ID number of the rule (index);

ip A.B.C.D: the appointed IP address of HTTP redirection;

domain WORD: the appointed domain name of HTTP redirection, the maximum range is 256.

**Default:** This command is not configured as default.

**Command Mode:** Captive Portal configuration mode.

**Usage Guide:** Configure the authentication domain name or ip address.

**Example:** Appoint the ip address as 1.1.1.1.

```
Switch (config-cp)# http-redirect-filter 1 ip 1.1.1.1
```

Appoint the domain name as www.dcn.com.

```
Switch (config-cp)# http-redirect-filter 1 domain www.dcn.com
```

### 13.1.22 http-redirect-filter <1-32>

**Command:** http-redirect-filter <1-32>  
no http-redirect-filter <1-32>

**Function:** Bind a rule to a instance of the captive portal. The no command deletes the redirect binding.

**Parameters:** <1-32>: the ID number of the rule (index).

**Default:** This command is not configured as default.

**Command Mode:** Captive Portal instance mode.

**Usage Guide:** Bind a rule to a instance of the captive portal.

**Example:** Bind the rule to the instance.

```
Switch (config-cp-instance)# http-redirect-filter 1
```

### 13.1.23 name

**Command:** name *<cp-name>*

no name

**Function:** Define the name of Captive Portal configuration.

**Parameter:** *<cp-name>*, the name of Captive Portal configuration, 32 characters can be included at most and they can be numbers and letters.

**Default:** None.

**Command Mode:** Captive Portal Instance configuration mode.

**Usage Guide:** Define the name of Captive Portal configuration.

**Example:** Define the name of Captive Portal configuration as abc123.

Switch(config-cp-instance)#name abc123

### 13.1.24 nas-ipv4

**Command:** nas-ipv4 *<A.B.C.D>*

no nas-ipv4 *<A.B.C.D>*

**Function:** Define the Captive Portal nas-ip address.

**Parameters:** *<A.B.C.D >*: IPv4 address of NAS.

**Default:** None.

**Command Mode:** Captive Portal mode.

**Usage Guide:** Define the Captive Portal nas-ip address.

**Example:** Configure the Captive Portal nas-ip address as 10.1.1.1.

Switch (config-cp)#nas-ip 10.1.1.1

### 13.1.25 portal enable configuration *<id>* [vlan-pool WORD ]

**Command:** portal enable configuration *<id>* [vlan-pool WORD ]

no portal enable [vlan-pool WORD ]

**Function:** Enable the portal function under the port. Appoint the instance number bound to the port and appoint which vlan can be enabled portal. One instance can be only bind to one port, but multiple vlan pools can be bound.

**Parameters:** *<id>*: the appointed instance number.

vlan-pool WORD: vlan pool, multiple vlan pools can be configured.

**Default:** None.

**Command Mode:** Port Mode.

**Usage Guide:** Enable the portal function under the port and bind the port to one instance. After binding, the rule under the instance can be applied to this port. If the parameter of

vlan is not appointed, the flow of all vlan under the port must be authenticated. Only the flow of the appointed vlan should be authenticated if the vlan is appointed. The flow of other vlan will be allowed.

If the parameter of vlan is not appointed, the portal authentication of all vlan will be disabled and the flow will be recovered normally. If the vlan is appointed, the portal authentication of the appointed vlan will be disabled and the flow of this vlan will be recovered normally. The flow of this vlan will be allowed.

**Example:** Configure the instance and vlan3 to be bound to configuration 1 under the port of 1/0/1

```
Switch (config-if-ethernet1/0/1)#portal enable configuration 1 vlan-pool 3
```

### 13.1.26 portal-server

**Command:** portal-server {ipv4 | ipv6} <name>

no portal-server {ipv4 | ipv6}

**Function:** This command can bind specific external portal server for the CP configuration. Networks under this CP configuration all redirect authentication through this portal server.

**Parameter:** <name> binding Portal server name.

**ipv4** the bond portal server address is ipv4 address.

**ipv6** the bond portal server address is ipv6 address.

**Default:** None.

**Command Mode:** Captive Portal Instance configuration mode.

**Usage Guide:** Use this command to bind specific external portal server for the CP configuration; it can also unbind the specific external portal server.

**Example:** Bind specific external portal server for the CP configuration.

```
Switch(config-cp -instance)#portal-server ipv4 x1
```

### 13.1.27 radius accounting

**Command:** radius accounting

no radius accounting

**Function:** Enable the accounting function of Captive Portal instance. The no command disables it.

**Parameters:** None.

**Default:** Disable.

**Command Mode:** Captive Portal Instance Mode.

**Usage Guide:** Enable the accounting function of Captive Portal instance.

**Example:** Enable the accounting function of Captive Portal instance.

```
Switch (config-cp-instance)#radius accounting
```

### 13.1.28 radius-accounting update interval

**Command:** `radius-accounting update interval <60-3600>`

`no radius-accounting update interval`

**Function:** Configure the accounting updating interval of the portal user that the switch sends to radius. The no command recovers it to be the default value.

**Parameters:** `<60-3600>` is the interval, the unit is second.

**Default:** 300 seconds.

**Command Mode:** Captive Portal Instance Mode.

**Usage Guide:** Configure the accounting updating interval of the portal user

**Example:** Configure the accounting updating interval of the portal user that the switch sends to radius as 60s.

```
Switch (config-cp-instance)# radius-accounting update interval 60
```

### 13.1.29 radius-acct-server

**Command:** `radius-acct-server <server-name>`

`no radius-acct-server`

**Function:** Define the radius accounting server name of the captive portal. The no command deletes it.

**Parameters:** `<server-name>`: name of radius accounting server.

**Default:** None.

**Command Mode:** Captive Portal Instance Mode.

**Usage Guide:** Define the radius accounting server name of the captive portal.

**Example:** Define the radius accounting server name of the captive portal as radius\_aaa\_1.

```
Switch (config-cp-instance)#radius-acct-server radius_aaa_1
```

### 13.1.30 radius-auth-server

**Command:** `radius-auth-server <server-name>`

`no radius-auth-server`

**Function:** Use this command to define the RADIUS authentication server of the Captive Portal configuration. The no command deletes the configuration.

**Parameter:** `<server-name>`, RADIUS authentication server name of Captive Portal configured.

**Default:** None.

**Command Mode:** Captive Portal Instance configuration mode.

**Usage Guide:** Define the RADIUS authentication server of the Captive Portal configuration.

**Example:** Define the RADIUS authentication server of the Captive Portal configuration as radius\_aaa\_1.

```
Switch(config-cp-instance)#radius-auth-server radius_aaa_1
```

### 13.1.31 redirect url-head <word>

**Command:** redirect url-head <word>

no redirect url-head

**Function:** Configure the redirect url-head including transmission protocol, host name, port and path. The no command deletes it.

**Parameters:** <word>, It is the redirect url-head such as https://200.101.13.4:8080/index.jsp or http:// www.portal.com/index.jsp. 128 characters can be input at most.

**Command Mode:** Captive Portal Instance Mode.

**Default:** None.

**Usage Guide:** This command is used to configure the redirect url-head including transmission protocol, host name, port and path. Configures according to the redirect url of the portal server. The transmission protocol, host name, port and path should be same for redirecting.

**Example:** Configure the redirect url-head as http://17.16.1.26/control.

```
Switch(config-cp-instance)#redirect url-head http://17.16.1.26/control
```

### 13.1.32 redirect attribute ssid enable

**Command:** redirect attribute ssid enable

no redirect attribute ssid enable

**Function:** Configure the redirect url to carry the parameter of ssid. The no command disables this function.

**Parameters:** None.

**Command Mode:** Captive Portal Instance Mode.

**Default:** Disable.

**Usage Guide:** This command is used to configure the redirect url to carry the parameter of ssid. After enabled this command, the redirect url will carry the ssid associated with client when the client conducts the redirection.

**Example:** Configure the redirect url to carry the parameter of ssid.

```
Switch(config-cp-instance)#redirect attribute ssid enable
```

### 13.1.33 redirect attribute ssid name

**Command:** `redirect attribute ssid name <word>`

**no redirect attribute ssid name**

**Function:** Configure the name of the parameter of ssid carried in the redirect url. The no command recovers it to be the default value.

**Parameters:** <word>, it is the ssid name including 32 characters at most.

**Command Mode:** Captive Portal Instance Mode.

**Default:** ssid.

**Usage Guide:** This command is used to configure the name of the parameter of ssid carried in the redirect url.

**Example:** Configure the name of the parameter of ssid carried in the redirect url as ssid.

```
Switch(config-cp-instance)#redirect attribute ssid name ssid
```

### 13.1.34 redirect attribute nas-ip enable

**Command:** `redirect attribute nas-ip enable`

**no redirect attribute nas-ip enable**

**Function:** Configure the redirect url to carry the parameter of nas-ip. The no command disables this function.

**Parameters:** None.

**Command Mode:** Captive Portal Instance Mode.

**Default:** Disable.

**Usage Guide:** This command is used to configure the redirect url to carry the parameter of nas-ip. After enabled this command, the redirect url will carry the IP address of switch associated with client when the client conducts the redirection.

**Example:** Configure the redirect url to carry the parameter of nas-ip.

```
Switch(config-cp-instance)#redirect attribute nas-ip enable
```

### 13.1.35 redirect attribute nas-ip name

**Command:** `redirect attribute nas-ip name <word>`

**no redirect attribute nas-ip name**

**Function:** Configure the name of the parameter of nas-ip carried in the redirect url. The no command recovers it to be the default value.

**Parameters:** <word>, it is the nas-ip name including 32 characters at most.

**Command Mode:** Captive Portal Instance Mode.

**Default:** acname.

**Usage Guide:** This command is used to configure the name of the parameter of nas-ip carried in the redirect url.

**Example:** Configure the name of the parameter of nas-ip carried in the redirect url as nasip.

```
Switch(config-cp-instance)#redirect attribute nas-ip name nasip
```

### 13.1.36 vlan-pool <1-255> <WORD>

**Command:** vlan-pool <1-255> <WORD>  
no vlan-pool <1-255>

**Function:** Before enable the authentication for the specific VLAN, configure the VLAN pool first. Appoint the range of the vlan or some vlan ID in the vlan pool and bind this vlan to the port. It can appoint one vlan to enable the authentication. The no command deletes the vlan pool.

**Parameters:** <1-255>: vlan-pool ID number (index);  
WORD: vlan id list.

**Default:** None.

**Command Mode:** Global Mode.

**Usage Guide:** It can appoint one vlan to enable the authentication. Configure the vlan pool and check if the element in the vlan pool is same with the one in other vlan pool. The element in the vlan which is already bound to the port cannot be modified.

**Example:** Enable the portal authentication function of vlan 1-100 and configure the vlan pool.

```
Switch (config)#vlan-pool 1 1-100
```

### 13.1.37 session-timeout

**Command:** session-timeout <0-86400>  
no session-timeout

**Function:** Define the session timeout of the Captive Portal. The no command disables this function.

**Parameters:** <0-86400>: the session timeout, unit is second. 0 means the timeout function is not effective.

**Default:** 86400.

**Command Mode:** Captive Portal Instance Mode.

**Usage Guide:** Define the session timeout of the Captive Portal.

**Example:** Define the session timeout of the Captive Portal as 100s.

```
Switch (config-cp-instance)# session-timeout 100
```

### 13.1.38 show captive-portal

**Command:** show captive-portal

**Function:** Shows the characteristics status of the Captive Portal.

**Parameter:** None.

**Default:** None.

**Command Mode:** Admin mode

**Usage Guide:** Show the relevant state parameters of the captive portal function on this switch.

**Example:** Show Captive Portal status of enable and disable.

captive portal enable:

```
Switch#show captive-portal
```

```
Administrative Mode..... Enable
```

```
Operational Status..... Enabled
```

```
CP IP Address..... 101.1.1.3
```

captive portal disable:

```
Switch#show captive-portal
```

```
Administrative Mode..... Disable
```

```
Operational Status..... Disabled
```

```
Disable Reason..... Administrator Disabled
```

```
CP IP Address..... 0.0.0.0
```

### 13.1.39 show captive-portal status

**Command:** show captive-portal status

**Function:** Shows the status of all the Captive Portal instance in the system.

**Parameter:** None.

**Default:** None.

**Command Mode:** Admin mode

**Usage Guide:** This command shows the captive portal configuration and the supported property parameters on this switch.

**Example:** Show the Captive Portal status of the controller.

```
Switch#show captive-portal status
```

```
Peer Switch Statistics Reporting Interval..... 120
```

```
Authentication Timeout..... 300
```

```
Authentication Type..... External
```

```
Supported Captive Portals..... 10
```

```
Configured Captive Portals..... 9
```

```
Active Captive Portals..... 0
Local Supported Users..... 128
Configured Local Users..... 0
System Supported Users..... 1024
Authenticated Users..... 0
```

### 13.1.40 show captive-portal configuration

**Command:** show captive-portal configuration <cp-id>

**Function:** Show the status of Captive Portal configuration.

**Parameter:** <cp-id> is the ID number of captive portal, range is 1 to 10.

**Default:** None.

**Command Mode:** Admin mode

**Usage Guide:** Show the configured parameters of portal instance.

**Example:** Show the configured situation of captive portal1.

```
Switch#show captive-portal configuration 1
CP ID..... 1
CP Name..... default
Operational Status..... Enabled
Block Status..... Not Blocked
Configured Locales..... 1
Authenticated Users..... 0
Permit-all Status..... Disabled
```

### 13.1.41 show captive-portal configuration interface

**Command:** show captive-portal configuration <cp-id> interface <IFNAME or ethernet>

**Function:** Shows all the interface information assigned to the captive portal configuration.

**Parameter:** <cp-id>, ID number of cp;  
 IFNAME ,Interface Name or number  
 Ethernet, Ethernet port

**Default:** None.

**Command Mode:** Admin mode

**Usage Guide:** Shows the interface state of the a portal instance.

**Example:** Shows all the interface information of Captive Portal configuration.

```
Switch # show captive-portal configuration 1 interface e1/0/1
CP ID..... 1
```

```

CP Name..... Default
Interface..... 1
Interface Description..... Ethernet1/0/1
Operational Status..... Enabled
Block Status..... Not Blocked
Authenticated Users..... 0
    
```

### 13.1.42 show captive-portal configuration status

**Command:** show captive-portal configuration [*<cp-id>*] status

**Function:** Shows the configuration information of all or specific Captive Portal.

**Parameter:** *<cp-id>*, ID number of cp, the parameter *<cp-id>* means the content of a instance, without the parameter to show all the current configured instance parameters.

**Default:** None.

**Command Mode:** Admin mode

**Usage Guide:** Show detailed configuration parameters of portal instance.

**Example:** Show all Captive Portal configuration information.

Show the status of all the instances:

Switch # show captive-portal configuration status

| CP ID | CP Name | Mode   | Protocol | Verification |
|-------|---------|--------|----------|--------------|
| 1     | Default | Enable | HTTP     | RADIUS       |
| 2     | Default | Enable | HTTP     | RADIUS       |

### 13.1.43 show captive-portal client status

**Command:** show captive-portal client [*<FF-FF-FF-FF-FF-FF>* { ipv4 | ipv6 } *<ip-addr>*] status

**Function:** This command shows detailed connection information or an overview of users connected to the captive portal.

**Parameter:** *<FF-FF-FF-FF-FF-FF>* is the MAC address of the user.

ipv4: user address is ipv4 address.

ipv6: user address is ipv6 address.

*<ip-addr>* is user address. Ipv4 address is decimal format with point and ipv6 address is the format of X:X::X:X.

**Default:** None.

**Command Mode:** Admin mode

**Usage Guide:** This command shows the status of all or a portal user.

**Example:** Show detailed information of user1 connected to the captive portal.

Switch # show captive-portal client status

| MAC Address       | IP Address | User Name | Protocol | Mode   | Session Time |
|-------------------|------------|-----------|----------|--------|--------------|
| 20-6a-8a-65-0d-17 | 66.1.1.2   | user1     | HTTP     | RADIUS | 0d:00:00:47  |

### 13.1.44 show captive-portal configuration client

**Command:** show captive-portal configuration [*<cp-id>*] client status

**Function:** This command shows the client information through the portal authentication in an interface.

**Parameter:** *<cp-id>*, ID number of Captive Portal.

**Default:** None.

**Command Mode:** Admin mode

**Usage Guide:** This command shows the user parameters of a portal instance.

**Example:** Show all the portal configuration information of the client passed authentication.

Switch #show captive-portal configuration 1 client status

```
CP ID..... 1
CP Name..... Default
  Client MAC Address  Client IP Address  Interface  Interface Description
  -----
  00-24-8c-00-99-27  10.1.1.51          1922      Port-Channel2
```

### 13.1.45 show captive-portal ext-portal-server status

**Command:** show captive-portal ext-portal-server status

**Function:** Use this command to check the status of the external portal server.

**Parameter:** None.

**Default:** None.

**Command Mode:** Admin mode.

**Usage Guide:** Check the status of the external portal server.

**Example:** Check the status of the external portal server.

Switch #show captive-portal ext-portal-server status

| Server Name | Server IP Address | port | SocketNo |
|-------------|-------------------|------|----------|
| x1          | 100.1.1.2         | 7749 | 0        |
| x2          | 100.1.1.1         | 7749 | 0        |

## 13.1.46 show captive-portal interface configuration status

**Command:** show captive-portal interface configuration [*<cp-id>*] status

**Function:** This command shows the interface information of all captive portal configuration or a specific configuration.

**Parameter:** *<cp-id>*, captive portal ID.

**Default:** None.

**Command Mode:** Admin mode

**Usage Guide:** This command shows the binding relationship of all or a portal instances with interface.

**Example:** Show the interface information of all captive portal configuration.

Switch #show captive-portal interface configuration status

| CP ID | CP Name | Interface | Interface Description | Type     |
|-------|---------|-----------|-----------------------|----------|
| 1     | Default | 1         | Ethernet1/0/1         | Physical |

## 13.2 Commands for Free-resource

### 13.2.1 free-resource(global)

**Command:** free-resource destination { ipv4 | ipv6 } *<ip-addr><netmask>* }

**no free-resource destination { ipv4 | ipv6 } *<ip-addr><netmask>* }**

**Function:** Configure the free-resource rules, the client who conforms the source IP address in rules can access the resources of the destination IP address in rules, the switch does not redirect, the client can access directly without Portal authentication.

**Parameter:** **ipv4** the configured free resource address is ipv4 address

**ipv6** the configured free resource address is ipv6 address

***<ip-addr>*** free-resource rules interviewees'/visitors' IP addresses.

***<netmask>*** free-resource rules interviewees'/visitors' IP addresses.

**Default:** None.

**Command Mode:** Global configuration mode.

**Usage Guide:** Configure the client address segment (visitor) which can be free to access the resources and the address segment which is free to provide the resource (interviewee).

**Example:** Set free-resource rules.

---

```
Switch (config)# free-resource destination ipv4 1.1.1.1/24
```

## 13.3 Authentication White-list

### 13.3.1 free-mac

**Command:** free-mac < MACADD>< MACMASK>  
no free-mac < MACADD>< MACMASK>

**Function:** Add the MAC without needing to authenticate. The no command deletes it.

**Parameters:** < MACADD>: mac address;  
< MACMASK>: mac mask.

**Default:** None.

**Command Mode:** Global Mode.

**Usage Guide:** For the user with the specific MAC without needing to authenticate, it means to allow the user without any authentication.

**Example:** Configure the MAC without needing to authenticate as 00-01-11-11-11-11.

```
Switch(Config)#free-mac 00-01-11-11-11-11
```

## 13.4 Commands for Automatic Page Pushing after Successful Authentication (it is not supported currently)

### 13.4.1 redirect attribute url-after-login enable

**Command:** redirect attribute url-after-login enable  
no redirect attribute url-after-login enable

**Function:** Enable the function that the redirect url carries the pushed url after the successful authentication. The no command disables this function.

**Parameters:** None.

**Command Mode:** Captive Portal Instance Mode.

**Default:** Disable.

**Usage Guide:** This command is used to enable the function that the redirect url carries the pushed url after the successful authentication. After enabled this command, the redirect url pushed by switch will carry the url which needs to be pushed after the successful authentication. At the same time, when the <url-value> of redirect attribute url-after-login

value is configured as empty, the carried url is the page url that the user access before the authentication. If it is not empty, the carried url is the page url configured by <url-value>.

**Example:** Enable the function that the redirect url carries the pushed url after the successful authentication.

```
Switch(config-cp-instance)#redirect attribute url-after-login enable
```

### 13.4.2 redirect attribute url-after-login name

**Command:** `redirect attribute url-after-login name <name>`

**no redirect attribute url-after-login name**

**Function:** Configure the attribute name of the pushed url after the successful authentication which is carried in the redirect url. The no command recovers it to be the default value.

**Parameters:** <name>, it is the attribute name including 32 characters at most.

**Command Mode:** Captive Portal Instance Mode.

**Default:** The default name is srcurl.

**Usage Guide:** This command is used to configure the attribute name of the pushed url after the successful authentication which is carried in the redirect url.

**Example:** Configure the attribute name of the pushed url after the successful authentication which is carried in the redirect url as redirect.

```
Switch(config-cp-instance)#redirect attribute url-after-login name redirect
```

### 13.4.3 redirect attribute url-after-login encode

**Command:** `redirect attribute url-after-login encode {plain-text|base64}`

**Function:** Configure the encode of the pushed url after the successful authentication which is carried in the redirect url.

**Parameters:** plain-text, it is the plain-text;

base64, It is the base64 encode.

**Command Mode:** Captive Portal Instance Mode.

**Default:** The default encode is plain-text.

**Usage Guide:** This command is used to configure the encode of the pushed url after the successful authentication which is carried in the redirect url. It can be configured according to the encode supported by the portal server.

**Example:** Configure the encode of the pushed url after the successful authentication which is carried in the redirect url as base64.

```
Switch(config-cp-instance)#redirect attribute url-after-login encode base64
```

## 13.4.4 redirect attribute url-after-login value

**Command:** `redirect attribute url-after-login value <url-value>`

**no redirect attribute url-after-login value**

**Function:** Configure the appointed url which is popped up after the success authentication. The no command deletes it.

**Parameters:** <url-value>, it is the configured appointed url including 512 characters at most.

**Command Mode:** Captive Portal Instance Mode.

**Default:** None.

**Usage Guide:** This command is used to configure the appointed url which is popped up after the success authentication. If enable the function that the redirect url carries the pushed url after the successful authentication, the redirect url will carry the url with the <url-value>.

**Example:** Configure the appointed url which is popped up after the success authentication as `http://www.test.com`.

```
Switch(config-cp-instance)#redirect attribute url-after-login value http://www.test.com
```

## 13.5 Commands for No Perception of Portal

### 13.5.1 fast-mac-auth

**Command:** `fast-mac-auth`

**no fast-mac-auth**

**Function:** This command configures to enable the quick mac authentication function. The no command disables it.

**Parameters:** None.

**Command Mode:** captive portal config mode.

**Default:** Disable.

**Usage Guide:** After enabled this command, there is no need to carry on the portal authentication if the mac authentication is successful.

**Example:** Enable the quick mac authentication function.

```
Switch(config-cp-instance)#fast-mac-auth
```

## 13.6 Commands for Portal Escaping

### 13.6.1 portal-server-detect server-name <name>

**Command:** portal-server-detect server-name <name> [interval <interval>] [retry <retries>][action {log | permit-all | trap }]

**no portal-server-detect server-name <name>**

**Function:** Enable the Portal server escaping function and configure the related parameters and the server configuration of status changing.

**Parameters:** <name> is the Portal server name, it is the string including 1 to 32 characters and the upper and lower case letters should be distinguished. This portal server must exist. <interval>: it is the interval of probing attempt, the range is from 20 to 600 and the unit is second. The default value is 20. <retries>: it is the maximum number of the probing failures, the range is from 1 to 5 and the default value is 3. If the probing failures achieve this value, the server is considered unreachable. { log | permit-all | trap }: when the unreachable status of the Portal server changed, it can trigger the configuration including the following situations and multiple configurations can be selected at the same times.

- ☞ log: when the unreachable status of the Portal server changed, the log information can be sent. In the log, it records the portal server name and the status information before and after the change of the server status.
- ☞ trap: when the unreachable status of the Portal server changed, the trap information can be sent to the network management server. In the trap, it records the portal server name and the status information before and after the change of the server status.
- ☞ permit-all: it is also named as portal escaping. It means to cancel the portal authentication temporarily and allow all the portal users accessing the network when the portal server is in the unreachable status (down). If the server status changes to the reachable status (up), the portal authentication function will be recovered.

**Default:** Disable. The default values of interval, retries and action are 20, 3 and permit-all respectively.

**Command Mode:** Captive Portal Global Configuration Mode.

**Usage Guide:** This command can be used to enable the portal escaping function when the portal server has fault. After enabled this function, there is no effect for the user authentication if the connection between switch and Portal server is normal; only when the connection between the switch and Portal server is broken, the user can be allowed accessing the network without the authentication. The operations can enable this function

too, but the triggered configuration must be selected as log or trap.

**Example:** Enable the escaping function of the portal server whose name is test. Configure the interval as 30s, configure the retries as 2 and configure the configuration of the server status change as log and permit-all.

```
Switch (config-cp)# portal-server-detect server-name test interval 600 retry 2 action log  
permit-all trap
```

## 13.6.2 portal-server-detect client-deauth

**Command:** portal-server-detect client-deauth

**no portal-server-detect client-deauth**

**Function:** Enable this command, the server status will change from down to up, all the users are forced down line. The no command disables this function, which means not to force the online user to get down the line after configured the detection status of portal server to change from down to up.

**Parameters:** None.

**Default:** Enable.

**Command Mode:** captive portal mode.

**Usage Guide:** All the users are forced down line when the server status is changed after enabled this command. It is the hidden command, the command of show run cannot view it.

```
Switch (config-cp)# portal-server-detect client-deauth
```

## 13.6.3 show captive-portal ext-portal-server server-name <name> status

**Command:** show captive-portal ext-portal-server server-name <name> status

**Function:** Show the portal server status including the server address and if the portal escaping function is enabled.

**Parameters:** <name> is the Portal server name, it is the string including 1 to 32 characters and the upper and lower case letters should be distinguished.

**Default:** None.

**Command Mode:** Admin Mode.

**Usage Guide:** Checking the server status is the important method to check the fault. When the portal escaping function is not effective, the configuration may be wrong; the command can be modified to help the administrator to remove the fault. If there is not the parameter of <name>, the status of all the servers will be shown. If there is the parameter of <name>, the detailed status information of the server will be shown.

**Example:** Show the status of all the ext-portal-server.

Show the detailed status of the server named as Portaltest.

Switch (config-cp)#show captive-portal ext-portal-server server-name Portaltest status

```

Server Name..... portaltest
Server IP..... 101.1.1.6
Server Port..... 7749
Server Key.....
Detect Mode..... Enable
Detect Interval..... 20
Detect Retries..... 3
Detect Trap Mode..... Disable
Detect Log Mode..... Disable
Detect Permit-all Mode..... Enable
Detect Operational Mode..... Enable
Detect Operational Status..... Down
Detect Operational Fails..... 1
Detect Operational Time..... 0d:00:00:11
    
```

# Chapter 14 Commands for VLAN-ACL

## 14.1 clear vacl statistic vlan

**Command:** clear vacl [in | out] statistic vlan [<1-4094>]

**Function:** This command can clear the statistic information of VACL.

**Parameter:** in | out: Clear the traffic statistic of the ingress/egress.

**vlan <1-4094>:** The VLAN which needs to clear the VACL statistic information.

If do not input VLAN ID, then clear all VLAN statistic information.

**Command mode:** Admin Mode.

**Default:** None.

**Usage Guide:** Egress direction filtering is not supported by switch.

**Example:**

Clear VACL statistic information of Vlan1.

```
Switch#clear vacl statistic vlan 1
```

## 14.2 show vacl vlan

**Command:** show vacl [in | out] vlan [<1-4094>] | [begin | include | exclude <regular-expression>]

**Function:** This command shows the configuration and the statistic information of VACL.

**Parameter:** in | out: Show ingress/egress configuration and statistic

**vlan <1-4094>:** The VLAN which needs to show the configuration and the statistic information of VACL. If do not input VLAN ID, then show VACL configuration and statistic information of all VLANs.

**begin | include | exclude <regular-expression>:** the regular expression

. match any characters except the line feed character

^ match the beginning of the row

\$ match the end of the row

| match the character string at the left or right of upright line

[0-9] match the number 0 to the number 9

[a-z] match the lowercase a to z

[aeiou] match any letter in "aeiou"

\ Escape Character is used to match the intervocalic character, for example,  
\\$ will match the \$ character, but it is not match the end of the character string

- \w match the letter, the number or the underline
- \b match the beginning or the end of the words
- \W match any characters which are not alphabet letter, number and underline
- \B match the locations which are not the begin or end of the word
- [^x] match any characters except x
- [^aeiou] match any characters except including aeiou letters
- \* repeat zero time or many times
- + repeat one time or many times
- (n) repeat n times
- (n,) repeat n or more times
- (n, m) repeat n to m times

At present, the regular expression used does not support the following syntaxes:

- \s match the blank character
- \d match the number
- \S match any characters except blank character
- \D match non-number character
- ? repeat zero time or one time

**Command mode:** Admin Mode.

**Default:** None.

**Usage Guide:** Egress direction filtering is not supported by switch.

**Example:**

Switch (config)#show vacl vlan 2

Vlan 2:

IP Ingress access-list used is 100, traffic-statistics Disable.

Switch (config)# show vacl vlan 3

Vlan 3:

IP Ingress access-list used is myacl, packet(s) number is 5.

| Displayed Information      | Explanation  |
|----------------------------|--|
| Vlan 2                     | The name of VLAN                                       |
| 100, myacl                 | The name of VACL                                       |
| traffic-statistics Disable | Disable VACL statistic function                        |
| packet(s) number is 5      | The sum of out-profile data packets matching this VACL |

## 14.3 `vacl ip access-group`

**Command:** `vacl ip access-group {<1-299> | WORD} {in | out} [traffic-statistic] vlan WORD`

**no vacl ip access-group {<1-299> | WORD} {in | out} vlan WORD**

**Function:** This command configure VACL of IP type on the specific VLAN.

**Parameter:** `<1-299> | WORD`: Configure the numeric IP ACL (include: standard ACL rule <1-99>, extended ACL rule <100-299>) or the named ACL.

**in | out:** Filter the ingress/egress traffic.

**traffic-statistic:** Enable the statistic of matched packets number.

**vlan WORD:** The VLAN will be bound to VACL.

**Command mode:** Global Mode.

**Default:** None.

**Usage Guide:** Use “,” or “-” to input the VLAN or multi-VLANs, but do not exceed 128, and CLI length cannot exceed 80 characters. Egress direction filtering is not supported by switch.

**Example:** Configure the numeric IP ACL and enable the statistic function for Vlan 1-5, 6, 7-9.

```
Switch(config)#vacl ip access-group 1 in traffic-statistic vlan 1-5; 6; 7-9
```

## 14.4 `vacl ipv6 access-group`

**Command:** `vacl ipv6 access-group (<500-699> | WORD) {in } (traffic-statistic) vlan WORD`

**no ipv6 access-group {<500-699> | WORD} {in } vlan WORD**

**Function:** This command configure VACL of IPv6 on the specific VLAN.

**Parameter:** `<500-699> | WORD`: Configure the IPv6 numeric standard ACL or IPV6 standard ACL rule.

**in** Filter the ingress traffic.

**traffic-statistic:** Enable the statistic of matched packets number.

**vlan WORD:** The VLAN will be bound to VACL.

**Command mode:** Global Mode.

**Default:** None.

**Usage Guide:** Use “,” or “-” to input the VLAN or multi-VLANs, but do not exceed 128, and CLI length cannot exceed 80 characters. Egress direction filtering and extended IPv6 is not supported by switch.

**Example:** Configure the numeric IPv6 ACL for Vlan 5.

```
Switch(config)#vACL ipv6 access-group 600 in traffic-statistic vlan 5
```

## 14.5 vACL mac access-group

**Command:** vACL mac access-group {<700-1199> | WORD} {in } [traffic-statistic] vlan WORD

**no vACL mac access-group** {<700-1199> | WORD} {in } vlan WORD

**Function:** This command configure VACL of MAC type on the specific VLAN.

**Parameter:** <700-1199> | WORD: Configure the numeric IP ACL (include: <700-799> MAC standard access list, <1100-1199> MAC extended access list) or the named ACL.

**in:** Filter the ingress traffic.

**traffic-statistic:** Enable the statistic of matched packets number.

**vlan WORD:** The VLAN will be bound to VACL.

**Command mode:** Global Mode.

**Default:** None.

**Usage Guide:** Use “,” or “-” to input the VLAN or multi-VLANs, but do not exceed 128, and CLI length cannot exceed 80 characters. Egress direction filtering is not supported by switch.

**Example:** Configure the numeric MAC ACL for Vlan 1-5.

```
Switch(config)#vACL mac access-group 700 in traffic-statistic vlan 1-5
```

## 14.6 vACL mac-ip access-group

**Command:** vACL mac-ip access-group {<3100-3299> | WORD} {in } [traffic-statistic] vlan WORD

**no vACL mac-ip access-group** {<3100-3299> | WORD} {in } vlan WORD

**Function:** This command configure VACL of MAC-IP type on the specific VLAN.

**Parameter:** <3100-3299> | WORD: Configure the numeric MAC-IP ACL or the named ACL.

**in:** Filter the ingress traffic.

**traffic-statistic:** Enable the statistic of matched packets number.

**vlan WORD:** The VLAN will be bound to VACL.

**Command mode:** Global Mode.

**Default:** None.

**Usage Guide:** Use “,” or “-” to input the VLAN or multi-VLANs, but do not exceed 128, and CLI length cannot exceed 80 characters. Egress direction filtering is not supported by switch.

**Example:** Configure the numeric MAC-IP ACL for Vlan 1, 2, 5.

```
Switch(config)#vACL mac-ip access-group 3100 in traffic-statistic vlan 1;2;5
```

# Chapter 15 Commands for SAVI

## 15.1 Commands for SAVI

### 15.1.1 ipv6 cps prefix

**Command:** `ipv6 cps prefix <ipv6-address> vlan <vid>`  
`no ipv6 cps prefix <ipv6-address>`

**Function:** Configure IPv6 address prefix of the link manually, no command deletes IPv6 address prefix.

**Parameter:** **ipv6-address:** the address prefix of link, like 2001::/64;  
**vid:** vlan ID of the current link.

**Command Mode:** Global Mode.

**Default:** None.

**Usage Guide:** Users should configure local address prefix: fe80::/64 of the link before enable the function of matching address prefix of the link, it accepts the packets of which source addresses are the local addresses of the link.

**Example:** Configure the address prefix of the link to 2001::/64.  
Switch(config)#ipv6 cps prefix 2001::/64

### 15.1.2 ipv6 cps prefix check enable

**Command:** `ipv6 cps prefix check enable`  
`no ipv6 cps prefix check enable`

**Function:** Enable SAVI address prefix check function, no command will disable this function.

**Parameter:** None.

**Command Mode:** Global Mode.

**Default:** Disable SAVI address prefix check function.

**Usage Guide:** After enable the prefix check function, if the IPv6 address prefix of the packets does not accord with the link prefix, then do not establish the corresponding IPv6 address binding. If users enable the matched address prefix of the link, configure the local address prefix of fe80::/64 first to accept the packets with the source address as local link address. Disable address prefix check function by default.

**Example:** Enable SAVI address prefix check function.  
Switch(config)#ipv6 cps prefix check enable

### 15.1.3 ipv6 dhcp snooping trust

**Command:** `ipv6 dhcp snooping trust`

`no ipv6 dhcp snooping trust`

**Function:** Configure the port as dhcpv6 trust port, it does not establish dynamic DHCPv6 binding again and allows all DHCPv6 protocol packets to pass; no command deletes the port trust function.

**Parameter:** None.

**Command Mode:** Port Mode.

**Default:** Disable.

**Usage Guide:** Set the port as dhcpv6 trust attribute, enable uplink port of the switch with SAVI function for connecting dhcpv6 server or dhcpv6 relay generally.

**Example:** Set ethernet1/0/1 to be DHCP trust port.

```
Switch(config)#interface ethernet1/0/1
```

```
Switch(config-if-ethernet1/0/1)#ipv6 dhcp snooping trust
```

### 15.1.4 ipv6 nd snooping trust

**Command:** `ipv6 nd snooping trust`

`no ipv6 nd snooping trust`

**Function:** Configure the port as slaac trust and RA trust port, this port will not establish dynamic slaac binding anymore and forwards RA packets. The no command deletes the port trust function.

**Parameter:** None.

**Command Mode:** Port Mode.

**Default:** Disable port trust function.

**Usage Guide:** If the port disables ipv6 nd snooping trust function, it is considered to untrust RA packets port and discards all RA packets. Setting the port as trust attribute, enable the uplink port of the switch with SAVI or the conjoint port between switches with SAVI generally.

**Example:** Set the port ethernet1/0/1 to be nd trust port.

```
Switch(config)#interface ethernet1/0/1
```

```
Switch(config-if-ethernet1/0/1)#ipv6 nd snooping trust
```

### 15.1.5 savi check binding

**Command:** `savi check binding <simple / probe> mode`

`no savi check binding mode`

**Function:** Configure the check mode for conflict binding; the no command deletes the

check mode.

**Parameter: simple mode:** only check the port state for conflict binding, if the state is up, keep the conflict binding and do not set new binding. If the state is down, delete the conflict binding to set a new one

**probe mode:** besides checking the port state for conflict binding, it will send NS packets to probe the usability of the corresponding user when the port state is up. If receiving the responded NA packets from users, it will keep the current conflict binding and does not set new binding, otherwise delete the conflict binding to set new one.

**Command Mode:** Global Mode.

**Default:** Disable the conflict binding check mode by default. It will adopt the mode that delete the conflict binding directly to set new one.

**Usage Guide:** It is recommended to configure probe mode to prevent the attack that the spurious address conflict binding deletes the legal user binding.

**Example:** Configure the conflict binding check mode to probe mode.

```
Switch(config)#savi check binding probe mode
```

## 15.1.6 savi enable

**Command:** savi enable

**no savi enable**

**Function:** Enable the global SAVI function, the no command disables this global function.

**Parameter:** None.

**Command Mode:** Global Mode.

**Default:** Disable the global SAVI function.

**Usage Guide:** Command configuration can be processed for SAVI function after enabling the global SAVI function. Because SAVI function has already contained security RA function, global SAVI function and security RA function are mutually exclusive in the global mode.

**Example:** Enable SAVI function.

```
Switch(config)#savi enable
```

## 15.1.7 savi ipv6 binding num

**Command:** savi ipv6 binding num <limit-num>

**no savi ipv6 binding num**

**Function:** Configure the number of the corresponding binding with the port, no command restores the default value.

**Parameter: limit-num:** set the range from 0 to 65535, the default value of the port binding number is 65535.

**Command Mode:** Port Mode.

**Default:** 65535.

**Usage Guide:** The configured binding number only include the dynamic binding type of slaac, dhcp. If the binding sum exceeds the configured number, this port does not create new dynamic binding any more, if the configured number is 0, this port does not create any dynamic binding.

**Example:** Configure the binding number to be 100 for port ethernet1/0/1.

```
Switch(config)#interface ethernet1/0/1
```

```
Switch(config-if-ethernet1/0/1)# savi ipv6 binding num 100
```

## 15.1.8 savi ipv6 check source binding

**Command:** `savi ipv6 check source binding ip <ip-address> mac <mac-address> interface <if-name> {type [slaac | dhcp] lifetime <lifetime> | type static}`

`no savi ipv6 check source binding ip <ip-address> interface <if-name>`

**Function:** Configure the static or dynamic binding function manually; the no command deletes the configured binding.

**Parameter:** **ip-address:** is the unicast IPv6 address, including local link and global unicast address

**mac-address:** is the mac address of Ethernet

**if-name:** is the port name, like interface ethernet 1/0/1

**slaac|dhcp:** **slaac** means create the dynamic binding for slaac type, **dhcp** means create the dynamic binding for dhcp type

**lifetime:** configure the lifetime period for the dynamic binding, the unit is second.

**static:** create the binding of the static type.

**Command Mode:** Global Mode.

**Default:** None.

**Usage Guide:** After the dynamic binding configured by handwork is overtime, the corresponding binding will be deleted but the configuration is still be kept, so the binding still be shown. If the binding needs to take effect again, it should delete it first and configure a new binding again.

When the binding type is static type, do not configure lifetime period, the lifetime period is infinite.

**Example:** Configure the dynamic binding of slaac type for SAVI manually.

```
Switch(config)#savi ipv6 check source binding ip 2001::10 mac 00-25-64-BB-8F-04
```

```
Interface ethernet1/0/1 type slaac lifetime 2010
```

Configure the static binding for SAVI manually.

```
Switch(config)#savi ipv6 check source binding ip 2001::20 mac 00-25-64-BB-8F-04
Interface ethernet1/0/1 type static
```

### 15.1.9 savi ipv6 check source ip-address mac-address

**Command:** `savi ipv6 check source [ip-address mac-address | ip-address | mac-address]`

`no savi ipv6 check source`

**Function:** Enable the control authentication function for the packets of the port, no command disables this function.

**Parameter:** None.

**Command Mode:** Port Mode.

**Default:** Disable the control filtering function of the port.

**Usage Guide:** The global SAVI function must be enabled before configuring this command.

**Example:** Enable the control filtering function of the packets on port ethernet1/0/1.

```
Switch(config)#interface ethernet1/0/1
```

```
Switch(config-if-ethernet1/0/1)# savi ipv6 check source ip-address mac-address
```

### 15.1.10 savi ipv6 {dhcp-only | slaac-only | dhcp-slaac} enable

**Command:** `savi ipv6 {dhcp-only | slaac-only | dhcp-slaac} enable`

`no savi ipv6 {dhcp-only | slaac-only | dhcp-slaac} enable`

**Function:** Enable SAVI application scene function, no command disables the function.

**Parameter:** **dhcp-only:** dhcp-only application scene

**slaac-only:** slaac-only application scene

**dhcp-slaac:** combination application scene of dhcp-only and slaac-only

**Command Mode:** Global Mode.

**Default:** Disable SAVI application scene.

**Usage Guide:** dhcp-only application scene only detects DHCPv6 packets and DAD NS packets of link-local ipv6 address to be IPv6 address with target field, it does not detect DAD NS packets of non-link-local address. slaac-only application scene detects DAD NS packets of all types. dhcp-slaac combination application scene detects all DHCPv6 and DAD NS packets. Disable all kinds of application scene detection function for SAVI by default.

**Example:** Enable the specified dhcp-only application scene for SAVI.

```
Switch(config)#savi ipv6 dhcp-only enable
```

### 15.1.11 savi ipv6 mac-binding-limit

**Command:** savi ipv6 mac-binding-limit <limit-num>

**no savi ipv6 mac-binding-limit**

**Function:** Configure the dynamic binding number of the same MAC address, no command restores the default value.

**Parameter: limit-num:** set the ranging from 1 to 10, the default dynamic binding number is 32 for the same MAC address.

**Command Mode:** Global Mode.

**Default:** 32.

**Usage Guide:** This command is used to prevent the exhaust attack of the dynamic binding entry for SAVI.

**Example:** Set the dynamic binding number to be 5 for the same MAC address.

```
Switch(config)#savi ipv6 mac-binding-limit 5
```

### 15.1.12 savi max-dad-dalay

**Command:** savi max-dad-delay <max-dad-delay>

**no savi max-dad-delay**

**Function:** Configure the dynamic binding at DETECTION state and send lifetime period of DAD NS packet detection, no command restores the default value.

**Parameter: max-dad-delay:** set the ranging between 1 and 65535 seconds, its default value is 1 second.

**Command Mode:** Port Mode.

**Default:** 1 second.

**Usage Guide:** It is recommended to use the default value.

**Example:** Set the detection lifetime as 2 seconds.

```
Switch(config)#savi max-dad-delay 2
```

### 15.1.13 savi max-dad-prepare-delay

**Command:** savi max-dad-prepare-delay <max-dad-prepare-delay>

**no savi max-dad-prepare-delay**

**Function:** Configure lifetime period of redetection for the dynamic binding, no command restores the default value.

**Parameter: max-dad-prepare-delay:** set the ranging between 1 and 65535 seconds, its default value is 1 second.

**Command Mode:** Global Mode.

**Default:** 1 second.

**Usage Guide:** It is recommended to use the default value.

**Example:** Set the redetection lifetime as 2 seconds.

```
Switch(config)#savi max-dad-prepare-delay 2
```

### 15.1.14 savi max-slaac-life

**Command:** `savi max-slaac-life <max-slaac-life>`

`no savi max-slaac-life`

**Function:** Configure lifetime period of slaac dynamic binding at BOUND state, no command restores the default value.

**Parameter: max-slaac-life:** set the ranging between 1 and 31536000 seconds, its default value is 4 hours.

**Command Mode:** Global Mode.

**Default:** 4 hours.

**Usage Guide:** None.

**Example:** Configure lifetime period of slaac binding type as 2010 seconds at BOUND state.

```
Switch(config)#savi max-slaac-life 2010
```

### 15.1.15 savi timeout bind-protect

**Command:** `savi timeout bind-protect <protect-time>`

`no savi timeout bind-protect`

**Function:** Configure the bind-protect lifetime period for a port after its state from up to down, no command restores the default value.

**Parameter: protect-time:** set the ranging between 1 and 300 seconds, its default value is 30 seconds.

**Command Mode:** Global Mode.

**Default:** 30 seconds.

**Usage Guide:** After the configured lifetime period is overtime, the port is still at down state, the binding of this port will be deleted. If the port state is changed from down to up state during the configured lifetime period, the binding of the port will reset it as lifetime period of BOUND state. If the configured parameter is 0 second, all binding of the port will be deleted immediately.

**Example:** Set bind-protect lifetime period to be 20 seconds.

```
Switch(config)#savi timeout bind-protect 20
```

## 15.2 Commands for Monitor and Debug

### 15.2.1 Monitor and Debug

#### 15.2.1.1 debug ipv6 dhcp snooping binding

**Command:** debug ipv6 dhcp snooping binding

**no debug ipv6 dhcp snooping binding**

**Function:** Enable binding debug of dhcp type for SAVI, no command disables the debug.

**Parameter:** None.

**Command Mode:** Admin Mode.

**Default:** None.

**Usage Guide:** After enable this function, the relative binding of dhcp type or static type create the print information for misarranging. The no command disables this function.

**Example:** Enable the binding debug of dhcp type.

```
Switch#debug ipv6 dhcp snooping binding
```

#### 15.2.1.2 debug ipv6 dhcp snooping event

**Command:** debug ipv6 dhcp snooping event

**no debug ipv6 dhcp snooping event**

**Function:** Enable event debug of dhcp type for SAVI, no command disables the debug.

**Parameter:** None.

**Command Mode:** Admin Mode.

**Default:** None.

**Usage Guide:** After enable event debug, the relative event information of dhcp type will be print for misarranging. The no command disables this function.

**Example:** Enable binding event debug of dhcp type.

```
Switch#debug ipv6 dhcp snooping event
```

#### 15.2.1.3 debug ipv6 dhcp snooping packet

**Command:** debug ipv6 dhcp snooping packet

**no debug ipv6 dhcp snooping packet**

**Function:** Enable the debug of DHCPv6 packets, no command disables the debug.

**Parameter:** None.

**Command Mode:** Admin Mode.

**Default:** None.

**Usage Guide:** After enable packets debug, the relative DHCPv6 packets will be print for misarranging. The no command disables this function.

**Example:** Enable the debug of DHCPv6 packets.

```
Switch#debug ipv6 dhcp snooping packet
```

#### 15.2.1.4 debug ipv6 nd snooping binding

**Command:** debug ipv6 nd snooping binding

no debug ipv6 nd snooping binding

**Function:** Enable the binding debug of slaac type for SAVI, no command disables the binding debug.

**Parameter:** None.

**Command Mode:** Admin Mode.

**Default:** None.

**Usage Guide:** After enable binding debug, the relative binding of slaac type will create the print information for misarranging. The no command disables this function.

**Example:** Enable binding debug of slaac type.

```
Switch#debug ipv6 nd snooping binding
```

#### 15.2.1.5 debug ipv6 nd snooping event

**Command:** debug ipv6 nd snooping event

no debug ipv6 nd snooping event

**Function:** Enable the event debug of slaac type for SAVI, no command disables the event debug.

**Parameter:** None.

**Command Mode:** Admin Mode.

**Default:** None.

**Usage Guide:** After enable event debug, the relative event information of slaac type will be print for misarranging. The no command disables this function.

**Example:** Enable the event debug of slaac type.

```
Switch#debug ipv6 nd snooping event
```

#### 15.2.1.6 debug ipv6 nd snooping packet

**Command:** debug ipv6 nd snooping packet

no debug ipv6 nd snooping packet

**Function:** Enable ND packets debug, no command disables ND packets debug.

**Parameter:** None.

**Command Mode:** Admin Mode.

**Default:** None.

**Usage Guide:** After enable packets debug, the relative ND packets will be print for misarranging. The no command disables this function.

**Example:** Enable ND packets debug.

Switch#debug ipv6 nd snooping packet

### 15.2.1.7 show savi ipv6 check source binding

**Command:** show savi ipv6 check source binding [interface<if-name>]

**Function:** Show the global SAVI binding entry list.

**Parameter: if-name:** port name such as interface ethernet 1/0/1.

**Command Mode:** Admin Mode.

**Default:** None.

**Usage Guide:** Descriptions of each field are as below:

| Field   | Description                 |
|---------|-----------------------------|
| MAC     | The bound MAC address       |
| IP      | The bound IP address        |
| Vlan    | The binding VLAN belongs to |
| Port    | The binding port belongs to |
| Type    | Binding type                |
| State   | Binding state               |
| Expires | The bound lifetime period   |

**Example:** Show the global binding state of SAVI.

Switch(config)#show savi ipv6 check source binding

Static binding count: 0

Dynamic binding count: 3

Binding count: 3

```

MAC          IP          VLAN  Port          Type      State      Expires
-----
00-25-64-bb-8f-04  fe80::225:64ff:febb:8f04  1 Ethernet1/0/5 slaac  BOUND  14370
00-25-64-bb-8f-04  2001::13  1 Ethernet1/0/5 slaac  BOUND  14370
00-25-64-bb-8f-04  2001::10  1 Ethernet1/0/5 slaac  BOUND  14370
-----
    
```
